INTRODUCTION

• Italian dairy cows are tipically fed on a forage system based upon

 Table 1: Experimental diets on DM % basis

Treatments

corn silage and alfalfa hay.

- •Corn grain and silage represent more than 50% on DM basis of the diet.
- •Partial replacement of corn silage with autumn-winter cereals or hay has no effect on milk yield and composition (Brito et al., 2006; Ahvenjarvi et al.,2006).
- •Non-structural carbohydrates (NSC) as starches, are the main source of energy for lactating dairy cows (NRC, 2001).
- Studies that compared different forage starch sources with differing digestibilities gave variable results on lactational performances and N excretion depending on starch level of intake, forage system and protein source degradability.

AIM

•To evaluate the effects of three different forage systems, based upon alfalfa hay (AH), barley silage (BS) and corn silage (CS) providing different sources and/or amounts of starch, on dairy cows lactational performances and efficiency of dietary nitrogen capture.

| Ingredient | AH | | BS | C | CS | |

MATERIALS AND METHODS

- Twenty four multiparous Italian Friesian cows divided into three groups according to parity, DIM (165±93) and milk production, were fed diets with 17% CP (on DM basis) (Table 1)
- •Chemical composition and nutrition characteristics of the diets are in Table 2.
- Experimental design was a Latin square (3x3) with three treatments and three periods of four weeks. The first two weeks were for adaptation, whereas the last two were sampling periods.
 N excretion was estimated on the difference between N intake and N milk, utilizing DMI, CP dietary, milk yield and protein content.

RESULTS

•No difference in milk protein and fat yield.
•No difference in milk chemical – physical parameters between treatments.
•Higher milk fat content in BS than in AH (P<0.05).

Higher milk urea content in CS and BS than in AH (P<0.001).
No difference for average DMI and BCS among groups (Table 3)
Estimate N excretion was reduced by 10% and 5% in BS compared to CS and AH respectively (Table 4)

CONCLUSIONS

•Partial substitution of corn silage with alfalfa hay or barley silage * does not influence milk production.

•Although its highest protein rumen degradation, barley silage does not increase N excretion probably because of its highest protein digestibility.
