INTRODUCTION

- ✓ Youli sows* comes from the Tai Zumu composite line.

*(Gene+)

INTRODUCTION

- ✓ Inclusion of Chinese breeds try to increase prolificacy of European breeds.
- ✓ This have an impact both in body composition and in the nutritional requirements of sows.
- ✓ During gestation sows are usually restricted, and that causes stress to them. Less restricted feeding programs could lead better sow behavior.
- ✓ However, this programs need to be economically feasible regarding the feeding cost and the productivity.

OBJECTIVE

- To evaluate the effect of the level of feed restriction during gestation on body weight, backfat depth and reproduction performance over two parities.

MATERIALS & METHODS

Experimental design

- ✓ Two treatments based on the feeding regime during gestation (liquid feeding) :

| Treatment | Backfat Thickness | Feeding regimen (kg feed/d) | | |
|-----------------------------|----------------------|-----------------------------|----------------------|----------------------|
| | | 1-26 d gestation | 27-89 d gestation | 90 d to farrowing |
| Experimental sows (ES) * | - | 2.83 | 2.83 | 2.83 |
| Control sows (CS) | <26 mm | 2.13 | 2.59 | 2.90 |
| | >26 mm | 2.13 | 2.29 | 2.59 |

*when a replicate consumed all feed for 1 week, increased feed supply by 10%

- ✓ All sows were fed *ad libitum* in lactation.
- ✓ 2 consecutive cycles.

MATERIALS & METHODS

| Raw materials, % | Gestation | Lactation |
|--|-----------|-----------|
| Barley and corn | 27.82 | 51.12 |
| Wheat bran | 26.56 | 11.65 |
| Protein meals | 10.79 | 19.37 |
| Beet pulp | 17.46 | 4.65 |
| Cane molasses | 2.90 | 2.34 |
| Lard and palm oil | 5.02 | 5.94 |
| Barley culms | 5.81 | 0.53 |
| Others | 3.63 | 4.40 |
| Calculated analysis¹ | | |
| Humidity, % | 10.2 | 10.7 |
| Ash, % | 6.2 | 5.9 |
| Net energy, kcal/kg | 2,193 | 2,467 |
| Dig. energy, kcal/kg | 3,136 | 3,437 |
| Dig. energy, MJ/kg | 13.12 | 14.38 |
| Crude protein, % | 12.5 | 15.3 |
| Ether extract, % | 7.0 | 8.1 |
| Crude fibre, % | 9.7 | 5.6 |
| Calcium, % | 0.89 | 0.96 |
| Av. Phosphorus, % | 0.20 | 0.24 |
| Av. Lysine, % | 0.38 | 0.63 |
| Av. Methionine, % | 0.20 | 0.29 |
| Av. Met + Cist, % | 0.28 | 0.40 |
| Av. Threonine, % | 0.30 | 0.46 |

EAAP, 2011

MATERIALS & METHODS

Experimental animals

- ✓ A total of 80 Youli nulliparous, primiparous, and multiparous sows (Gene+ Ibérica).
- ✓ All sows were distributed in four batches regarding treatments, body weight, and backfat thickness.

Experimental facilities

- ✓ Gestation: Groups of 5 ♀ - boxes
 - ✓ 18,3 m² (4.55 × 4.05 m²).
- ✓ Lactation: Individual box
 - ✓ 4,30 m² (2.55 × 1.69 m²)
 - ✓ Farrowing crates of 2.10 × 0.60 m².

MATERIALS & METHODS

Controls

- ✓ Over two parities, measures:
 - ✓ Body weight and backfat thickness at:
 - ✓ Insemination, 7 d pre-farrowing, and weaning.

- ✓ Feed intake (group/sow).

8

EAAP, 2011

MATERIALS & METHODS

Controls

- ✓ Over two parities, measures:
 - ✓ Pigs at farrowing
 - ✓ Total, alive, dead, mummified
 - ✓ Weaned piglets
 - ✓ Litter weight at farrowing
 - ✓ Litter weight at weaning

MATERIALS & METHODS

Statistical analyses

- ✓ GLM procedure
- ✓ Model:
 - ✓ Feeding regimen,
 - ✓ Batch, and initial parity number as main effects.
- ✓ Data are presented as least square means.

CONCLUSIONS

- Feed restriction stabilizes the body condition of sows:
 - Less consumption and increase of BW and BT during gestation but...
 - More consumption and less decrease of BW and BT during lactation.
- Different feeding regime change the body composition in some extent
- The increase of feeding regime in this line had not beneficial effects different to theoretical better behavior

EAAP, 2011

MESSAGE TO TAKE HOME

- It is possible to increase the feeding regime to increase the behavior, but it has not additional supplemental benefits and increases feed cost and leads fatter sows.
