63rd EAAP Annual Meeting - Bratislava, Slovakia
(27th August – 31st August 2012)

Introduction

Welfare :
multidimensional
concept

Four criteria

- Good feeding
- Good housing
- Good health
- Appropriate behaviour

Aim of study

Develop a Multidimensional evaluation system for animal welfare

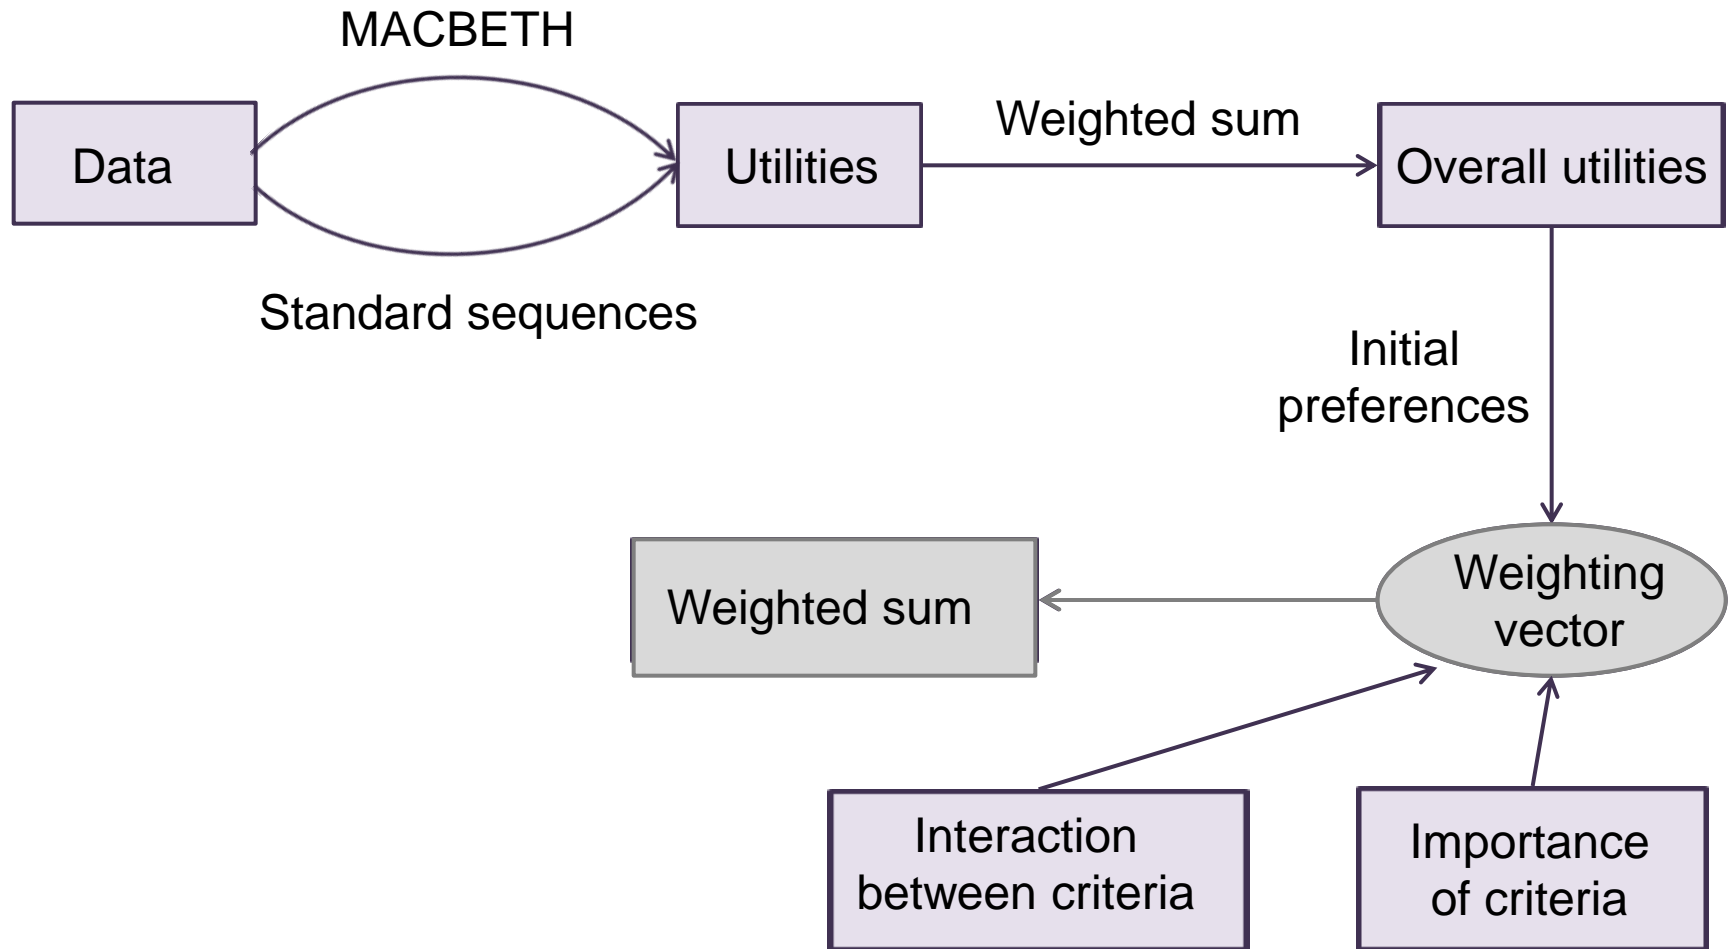

- Compensation
- Importance
- Interactions

Choquet Integral

Labreuche and Grabisch (2003)

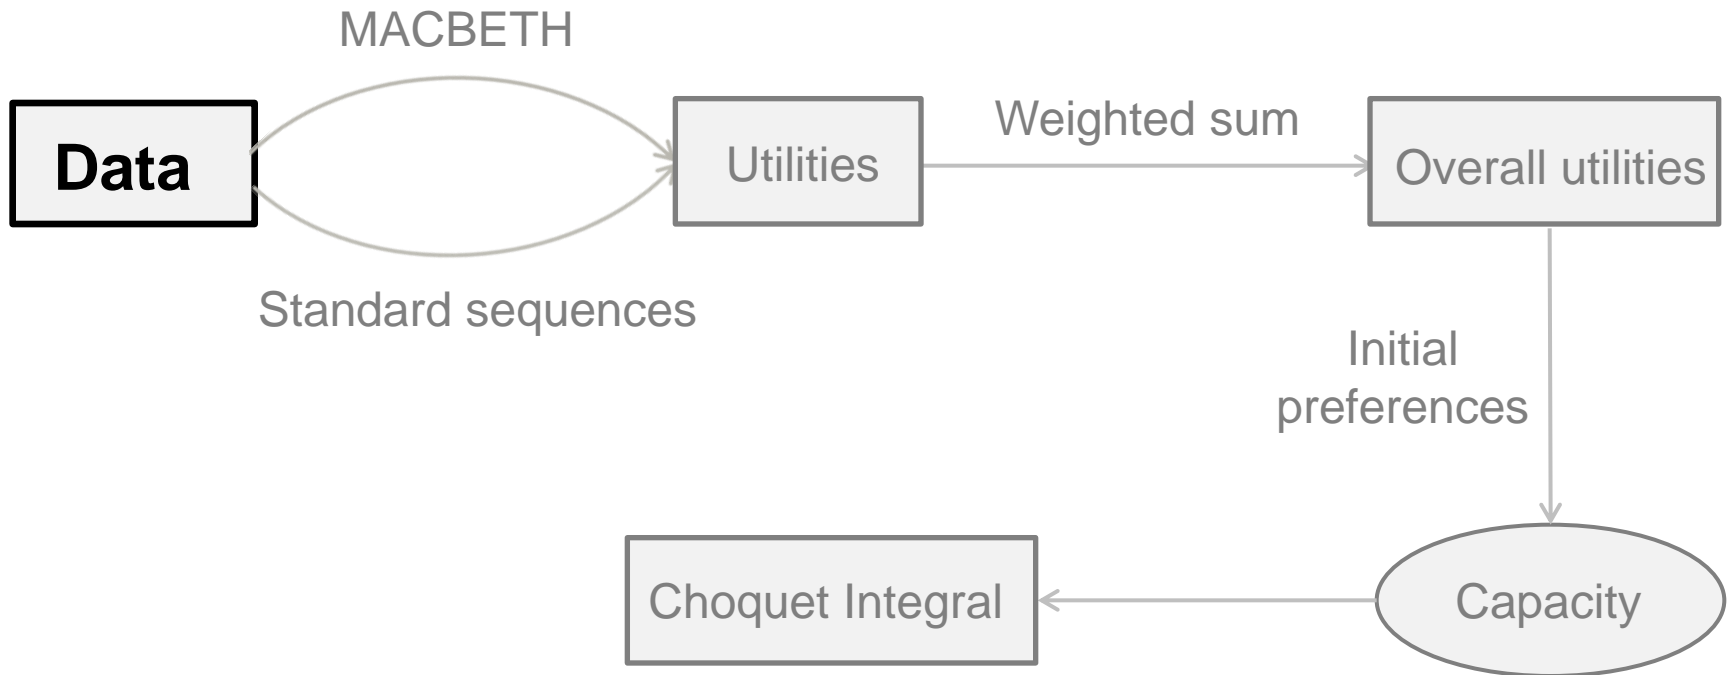

Outline- Model

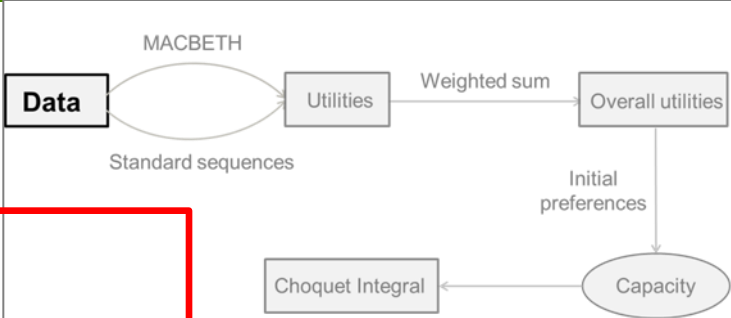

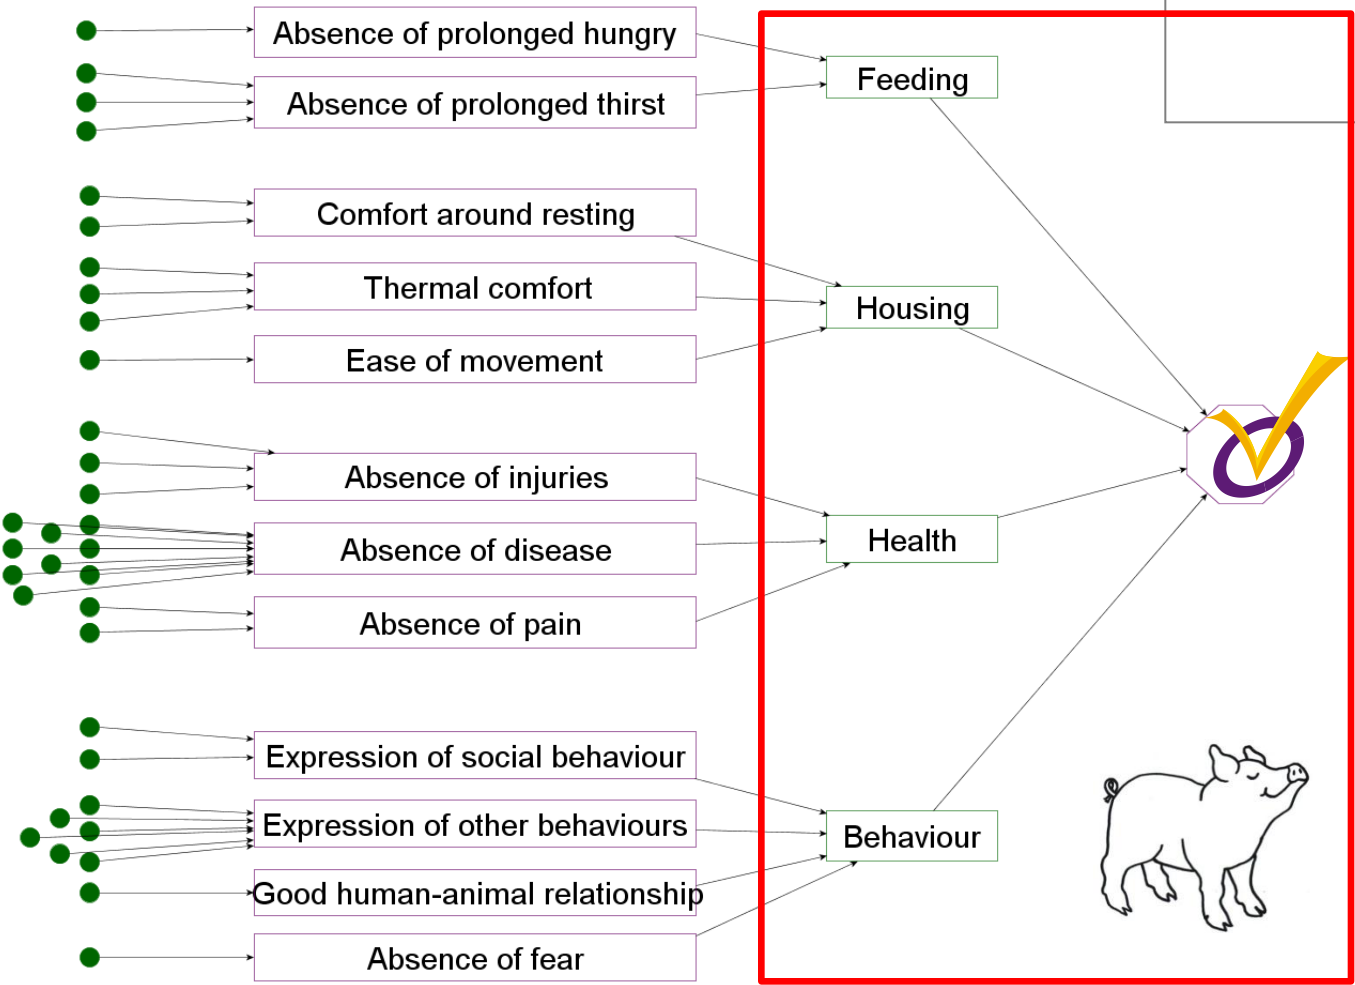

Outline

Material and methods - Measures

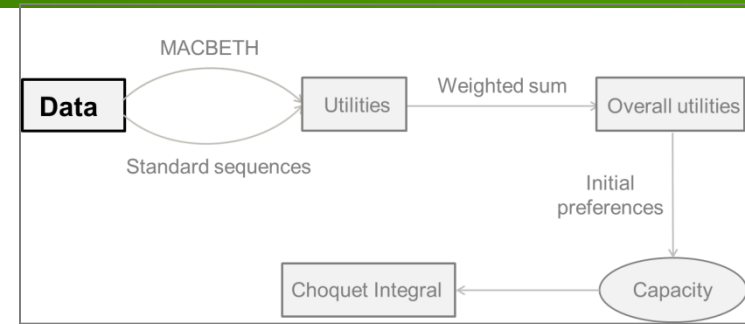

Material and methods - Data

Example: 9 farms

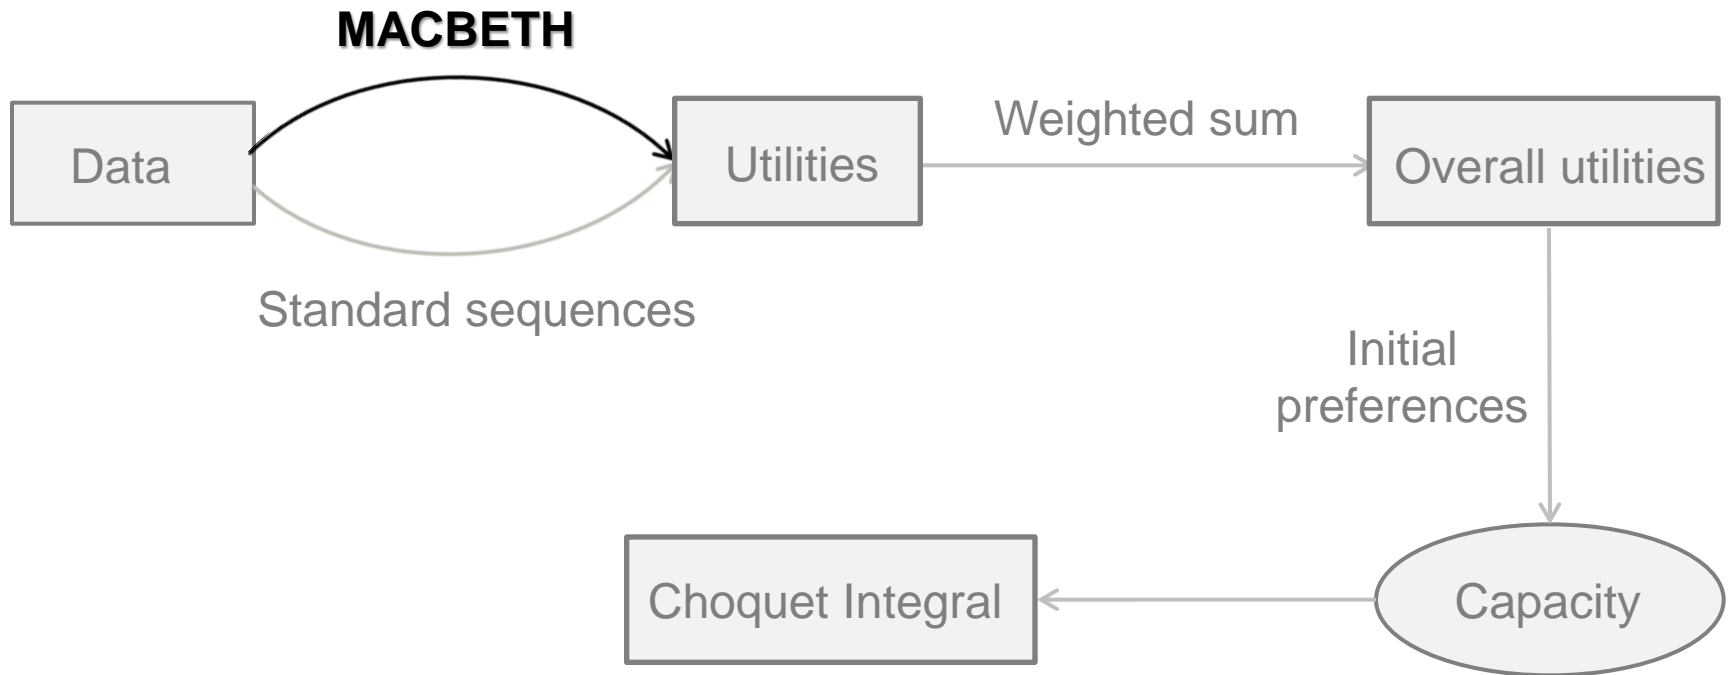

Farm	Feeding	Housing	Health	Behaviour
a	3	6	13	2
b	3	6	13	1
c	3	6	13	0
d	3	6	8	2
e	3	6	7	2
f	3	6	4	2
g	2	4	8	2
h	1	4	11	2
i	1	2	13	2

Criterion	Range
Feeding	0-3
Housing	0-6
Health	0-13
Behaviour	0-2

Outline

Material and methods - MACBETH

1. Define quantitative performances

2. Define reference scores

Properties of Housing

Name : Housing

Comments :

Basis for comparison :

- the options
- the options + 2 references
- qualitative performance levels :
- quantitative performance levels :

Performance levels :

-	+	Quantitative level
1		6
2		5
3		4
4		3
5		2
6		1
7		0

Indicator :

Short :

Reference scores

[all upper] 1

[all lower] 0

OK

Cancel

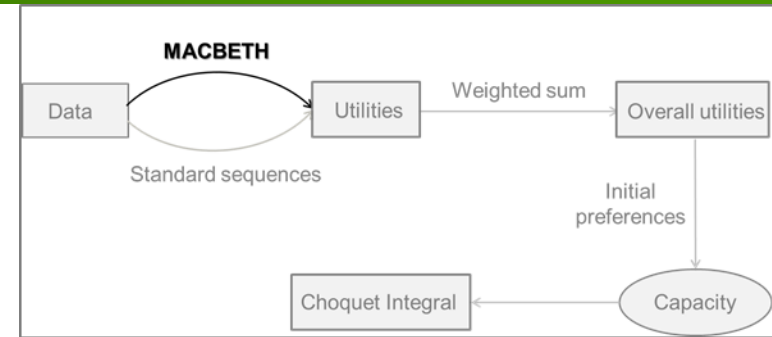

MACBETH

Data → Utilities (Standard sequences) → Overall utilities (Weighted sum) → Capacity (Initial preferences) → Choquet Integral

Material and methods - MACBETH

Qualitative judgements

Housing

	6	5	4	3	2	1	0	Current scale	
6	no	very weak	weak	strong	strg-vstr	vstrg-extr	extreme	1.00	extreme
5		no	very weak	strong	strg-vstr	v. strong	extreme	0.93	v. strong
4			no	strong	strg-vstr	strg-vstr	v. strong	0.86	strong
3				no	moderate	mod-strg	strg-vstr	0.57	moderate
2					no	moderate	strong	0.36	weak
1						no	weak	0.14	very weak
0							no	0.00	no

Consistent judgements

3. Qualify the strength of difference between criteria levels

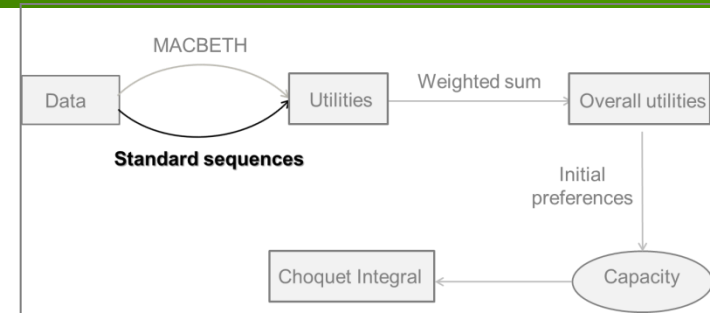

Outline

Material and methods – STANDARD SEQUENCES

MACBETH	STANDARD SEQUENCES
Qualitative judgements	Quantitative judgements
Qualify the strength of difference between criteria levels	Quantify the increase in the value of a criterion that would compensate the decrease of one unit in other criterion

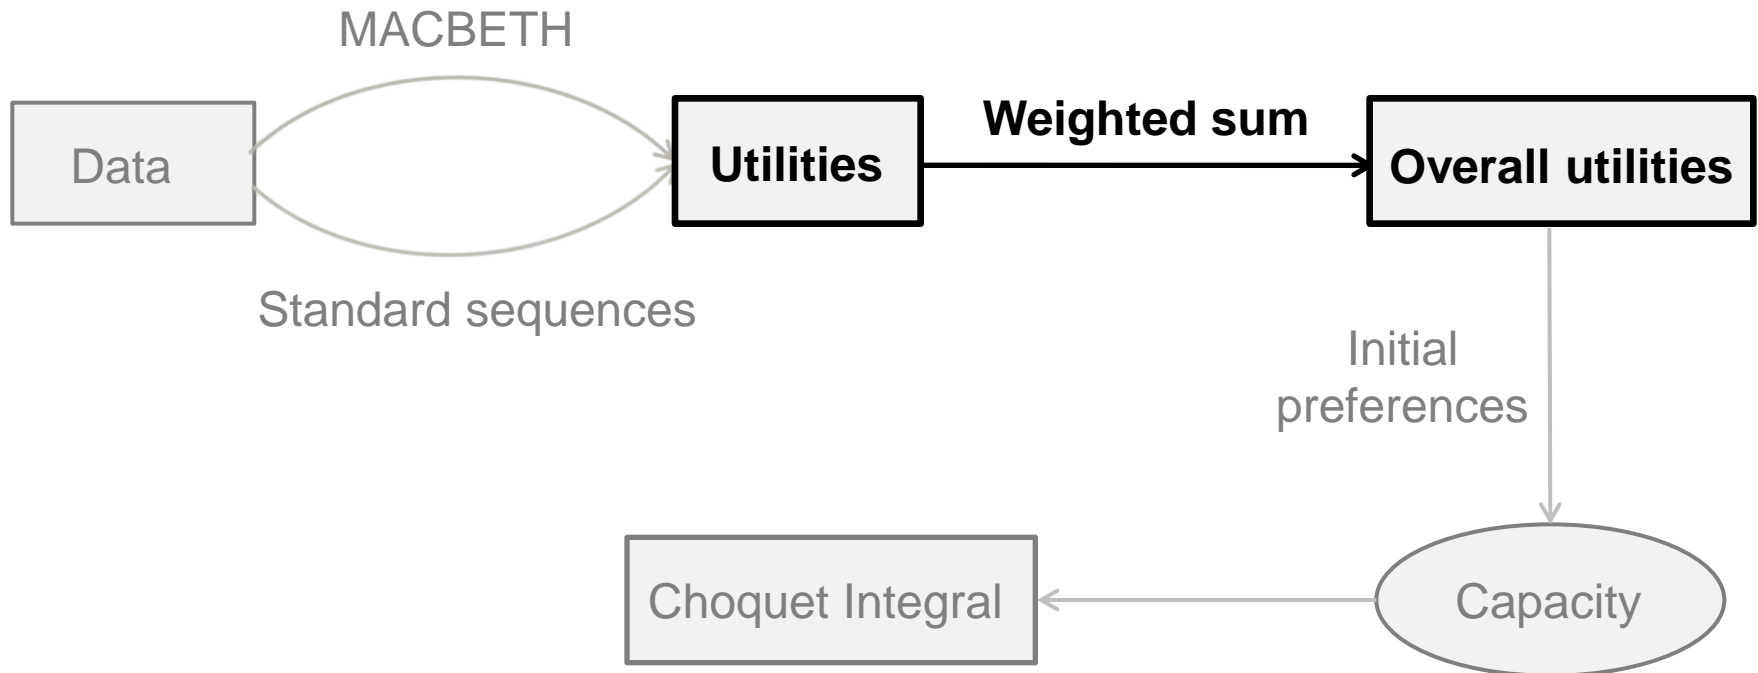

Feeding

Housing

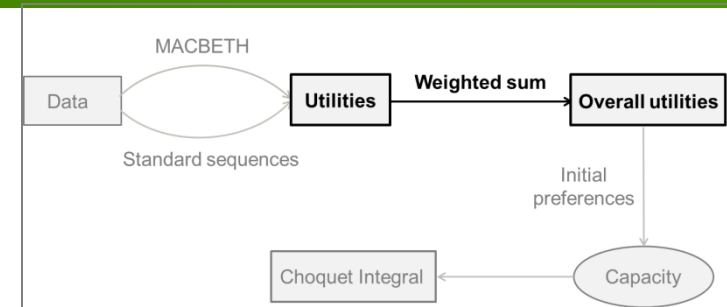

Outline

Results and discussion

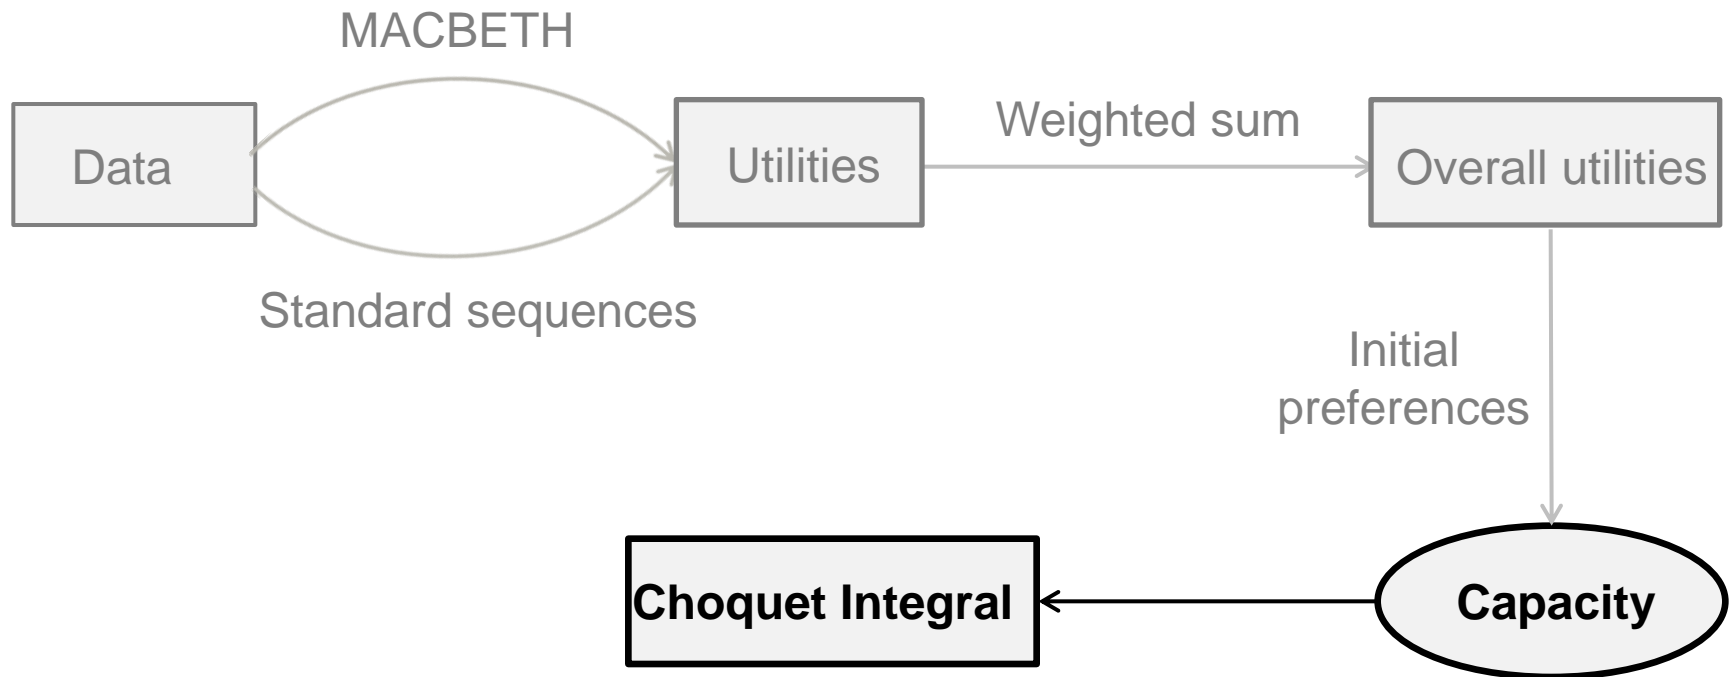

Overall utilities and rankings for the 9 farms calculated by the Standard Sequences (SS) and by MACBETH

Farm	SS Utility Value	SS Ranking	MACBETH Utility value	MACBETH Ranking
a	1	1	1	1
b	0.818	4	0.873	4
c	0.636	9	0.667	9
d	0.860	2	0.933	2
e	0.832	3	0.877	3
f	0.748	8	0.790	7
g	0.762	7	0.869	5
h	0.815	5	0.868	6
i	0.803	6	0.780	8

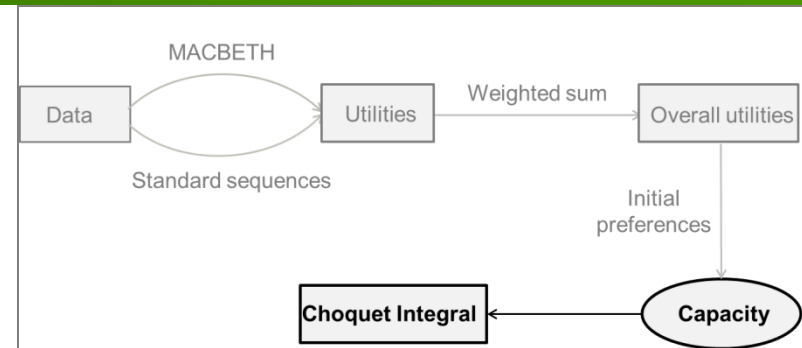

Outline

Material and methods – Capacity and Choquet integral

- Least squares based approaches were implemented within the Kappalab R package following the method described by Grabisch et al. (2008).

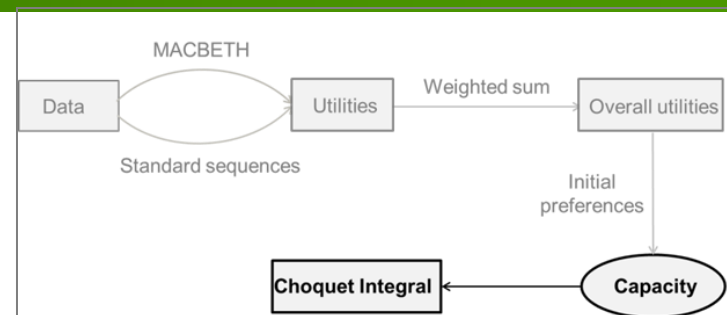

- Interactions indices constraints were imposed → criteria regarded as complementary → no compensation allowed between them.
- Importance values constraints were imposed → importance of the criteria follows the next order:

Health = Behaviour > Housing > Feeding

Results and discussion

Choquet Integral (CI) results

Farm	CI (SS)	CI (SS) Ranking	CI (MACBETH)	CI (MACBETH) Ranking
a	1	1	1	1
b	0.789	4	0.799	4
c	0.578	9	0.597	9
d	0.835	2	0.849	2
e	0.802	3	0.819	3
f	0.704	8	0.728	7
g	0.735	6	0.730	6
h	0.766	5	0.753	5
i	0.733	7	0.697	8

Conclusion

- **Utilities** aggregated with the **weighted sum** → do not reflect DM preferences and several ranking reversals between results through different methods are obtained
- **Choquet integral** results → in accordance with the DM preferences and few ranking reversal between results are obtained through different methods
- Outlook → use of **MACBETH** preferable, simpler than standard sequences and no significant differences between results
