

Assessing climatic effects on the reproductive performance of sows in a temperate climate

Christian Lambertz, Kerstin Wegner and Matthias Gauly

Department of Animal Sciences
Georg-August-University Göttingen, Germany

Negative effects of high temperatures on sows

Weaning-to-service interval	Almond & Bilkei, 2005 Prunier et al., 1997
Conception rate	Almond & Bilkei, 2005 Suriyasomboon et al., 2006
Litter size	Almond & Bilkei, 2005 Edwards et al., 1968
Live born piglets	Omtvedt et al., 1971
Stillborn piglets	Omtvedt et al., 1971

Heat stress effects during gestation

Day of gestation	Effect
8. – 16.	Disordered implantation of embryos, Reduced conception rates, Reduced no. of vital embryos
53. – 61.	No effects of heat stress
102. – 110.	Less live born, more stillborn piglets

Omtvedt et al. (1971)

When does heat stress begin ?

- Above 22 °C (Black et al., 1993)
- But: temperature explains climatic effects insufficiently
 - Development of temperature-humidity index (THI) as heat stress indicator
 - No exact thresholds for sows described

Objectives

What effects does the THI have on the reproductive performance in sows ?

Materials and Methods

- 6 indoor sow farms in Northern Germany
- Juli 2011 – August 2012

Measurements

- Temperature and relative humidity recorded
- 2 data loggers
 - Farrowing,
 - Waiting,
 - Servicing compartment

Temperature-humidity index

NWSCR (1976):

$$\text{THI} = [(1.8 T) + 32] - [0.55 (\text{RH}/100) * [((1.8 T) + 32) - 58]]$$

where T is the temperature (°C) and RH the relative humidity (%)

Reproductive performance

- 8 274 litters
- Herd monitoring program db-Planer (BHZP, Ellringen)
 - Mating date and no.
 - Parity no.
 - Farrowing and weaning date
 - No. of live born and stillborn piglets
 - No. of weaned piglets
 - Preweaning mortality
 - Weaning-to-service interval

Statistics

$$Y_{ijklm} = \mu + P_i + S_j + PS_k + F_l + THI + e_{ijklm}$$

- Y_{ijklm} = reproductive parameter
- μ = overall mean
- P_i = fixed effect of parity i (5 classes)
- S_j = fixed effect of season j (4 classes)
- PS_k = fixed effect of the interaction between parity and season
- F_l = fixed effect of the farm (1 to 6)
- THI = covariate
- e_{ijklm} = random residual term

THI effects

– After AI

THI effects

– After AI

– Before farrowing

THI effects

– After AI

– Before farrowing

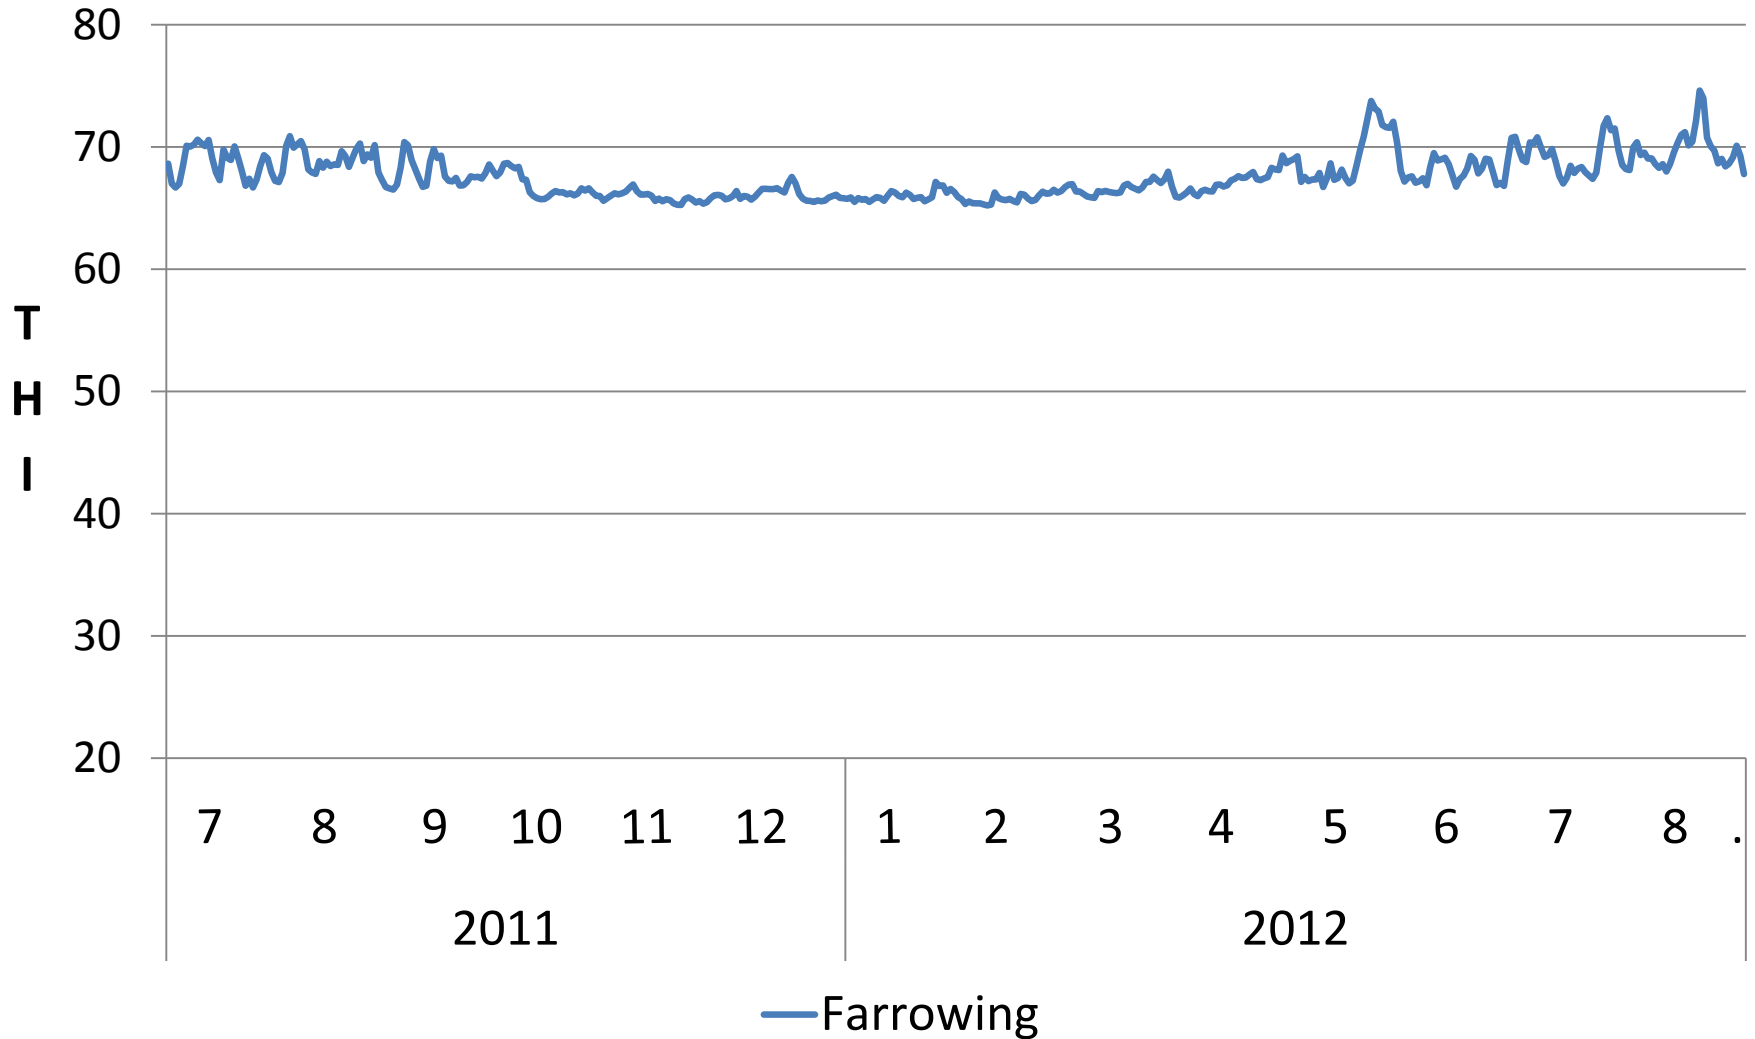

– After farrowing

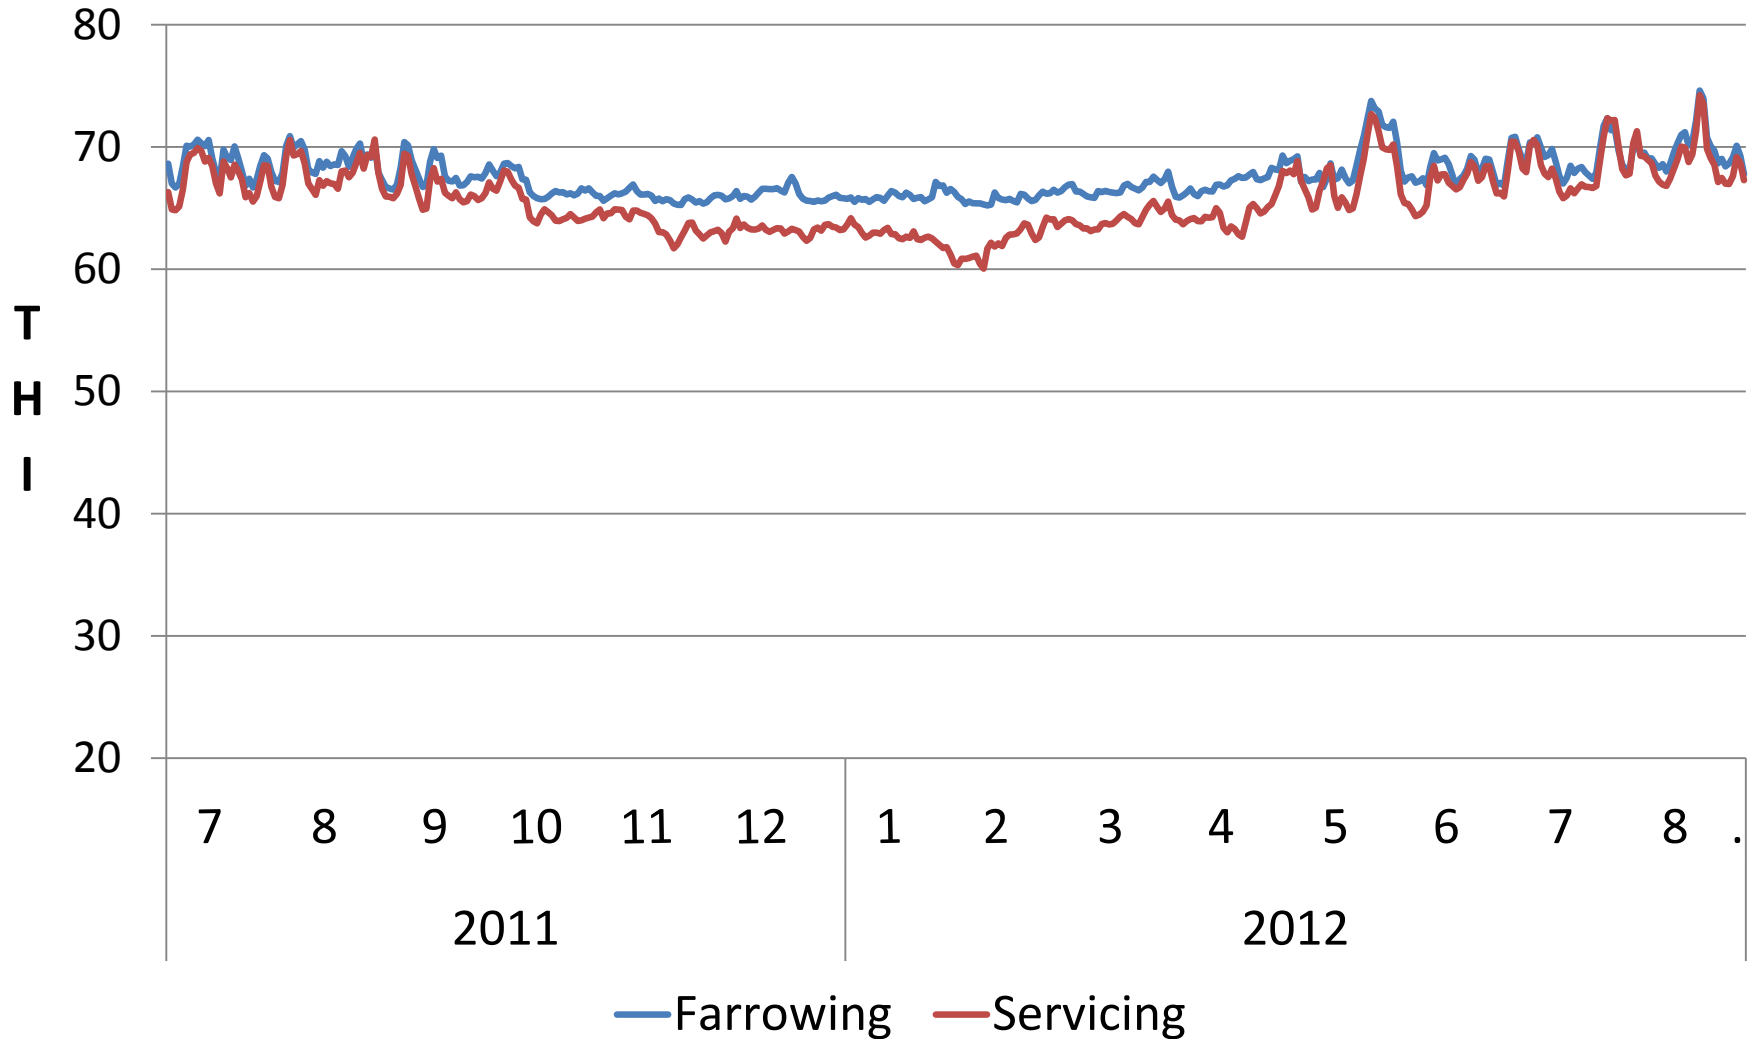

Results and discussion

Course of the THI

Course of the THI

Course of the THI

Course of the THI

Fixed effect of parity

- Litter size

Fixed effect of parity

- Litter size

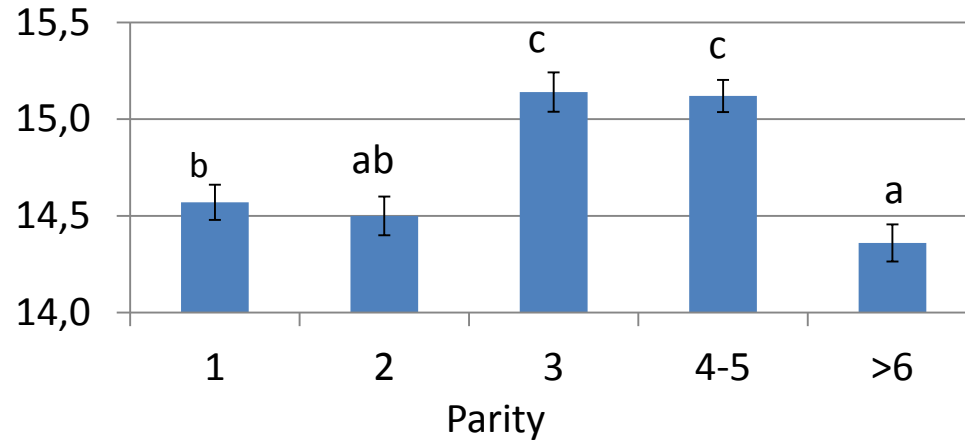

- Live born piglets

Fixed effect of parity

- Litter size

p<0.001

- Live born piglets

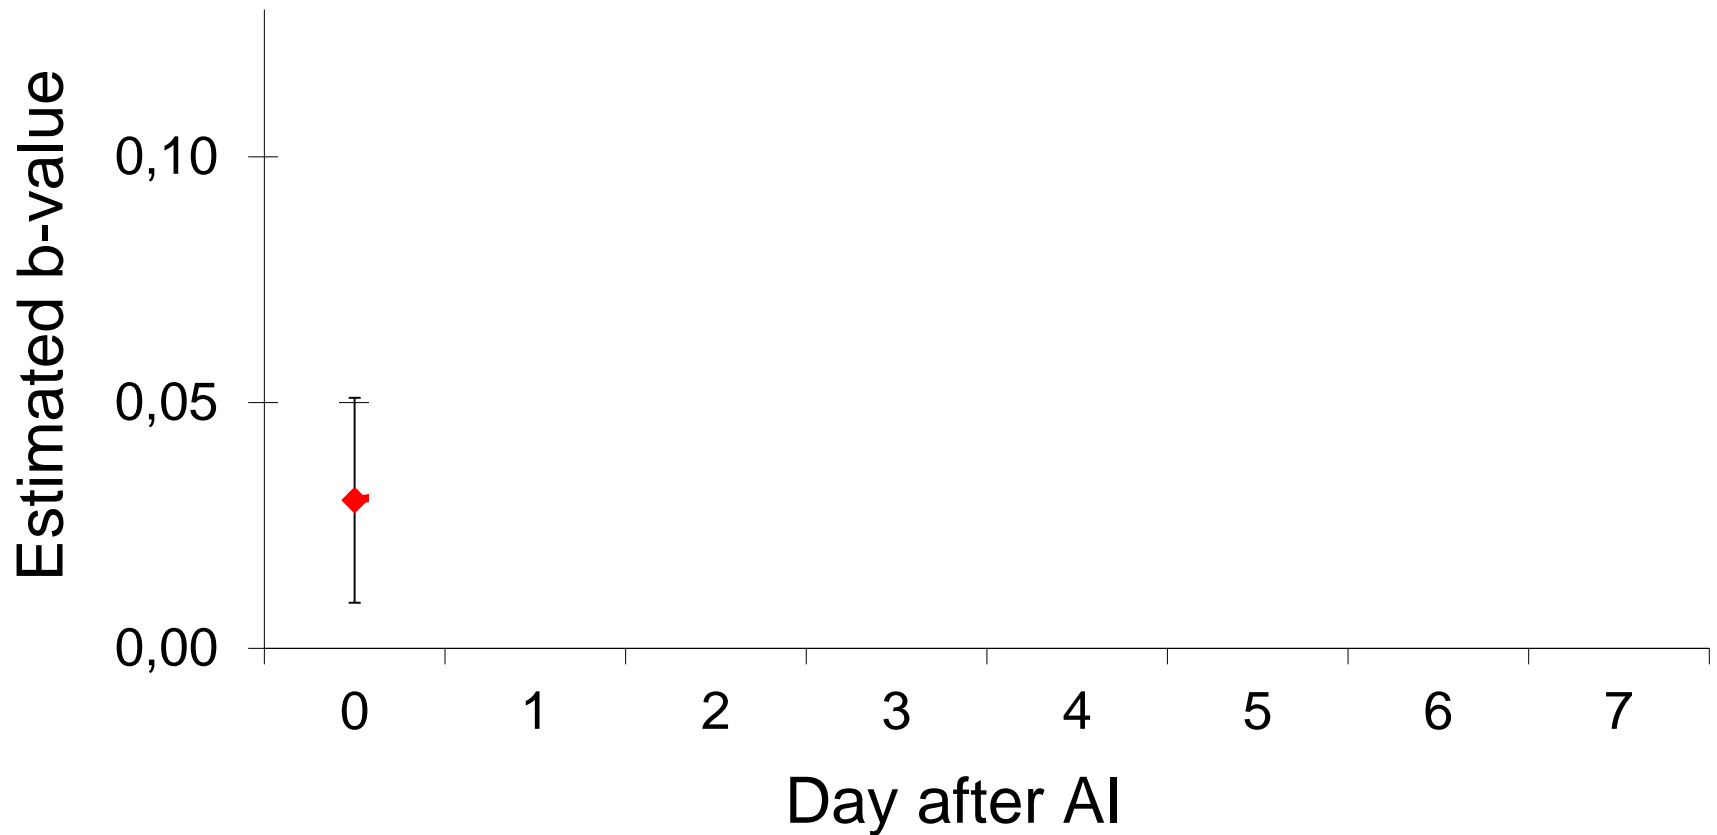

p<0.001

- Stillborn piglets

p<0.001

Effect of THI after AI on litter size

Effect of THI after AI on litter size

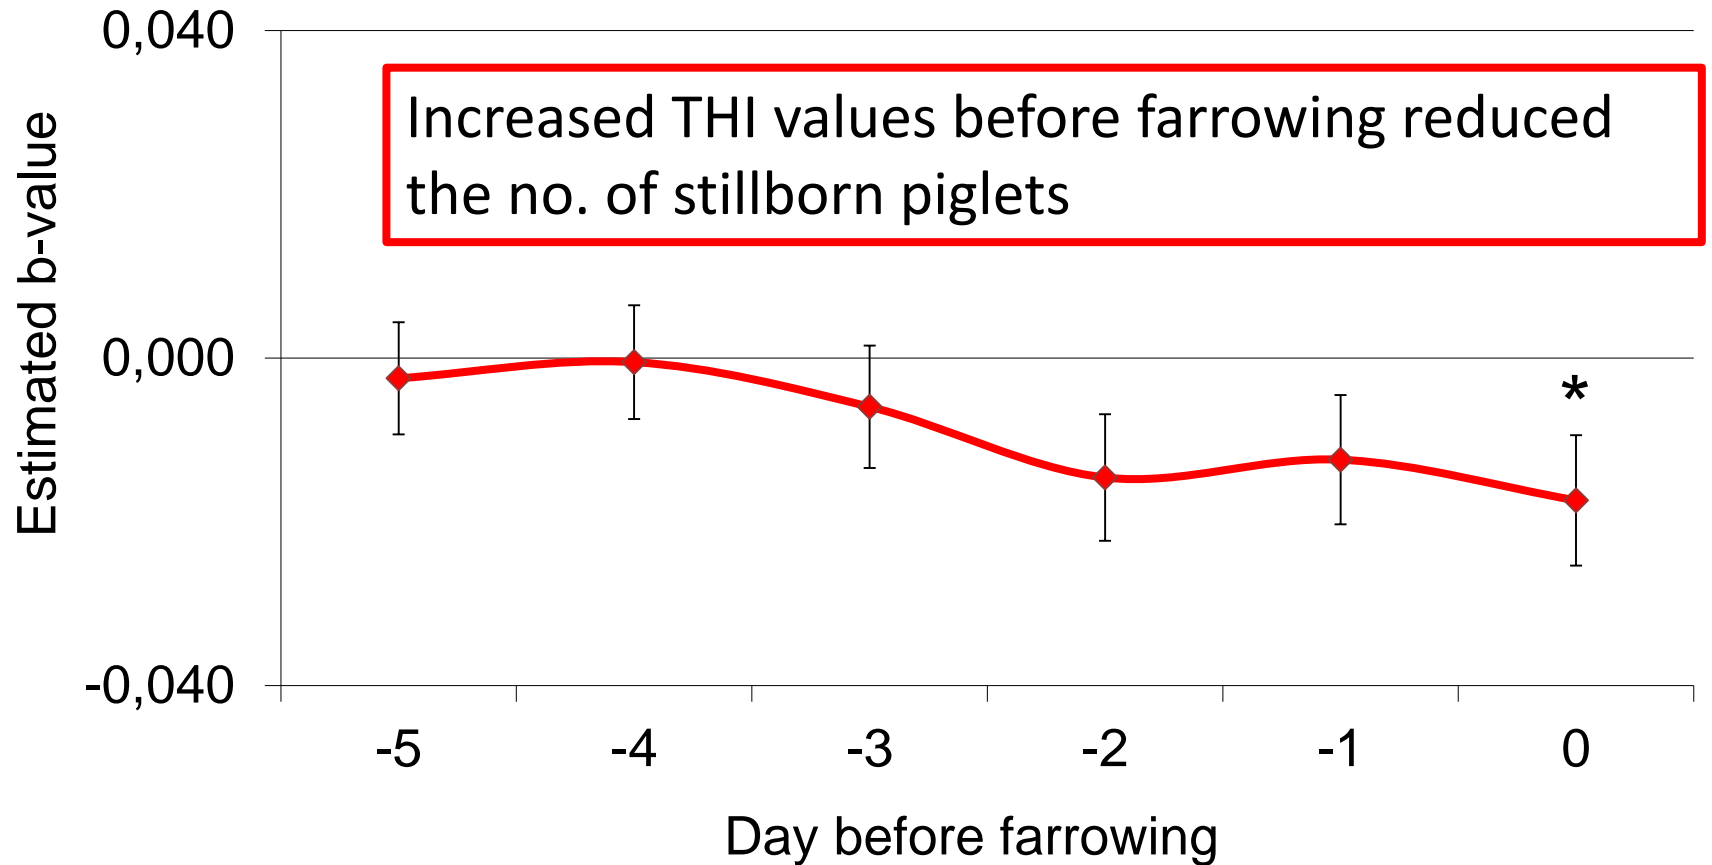

* $p < 0.05$

Effect of THI before farrowing on live born piglets

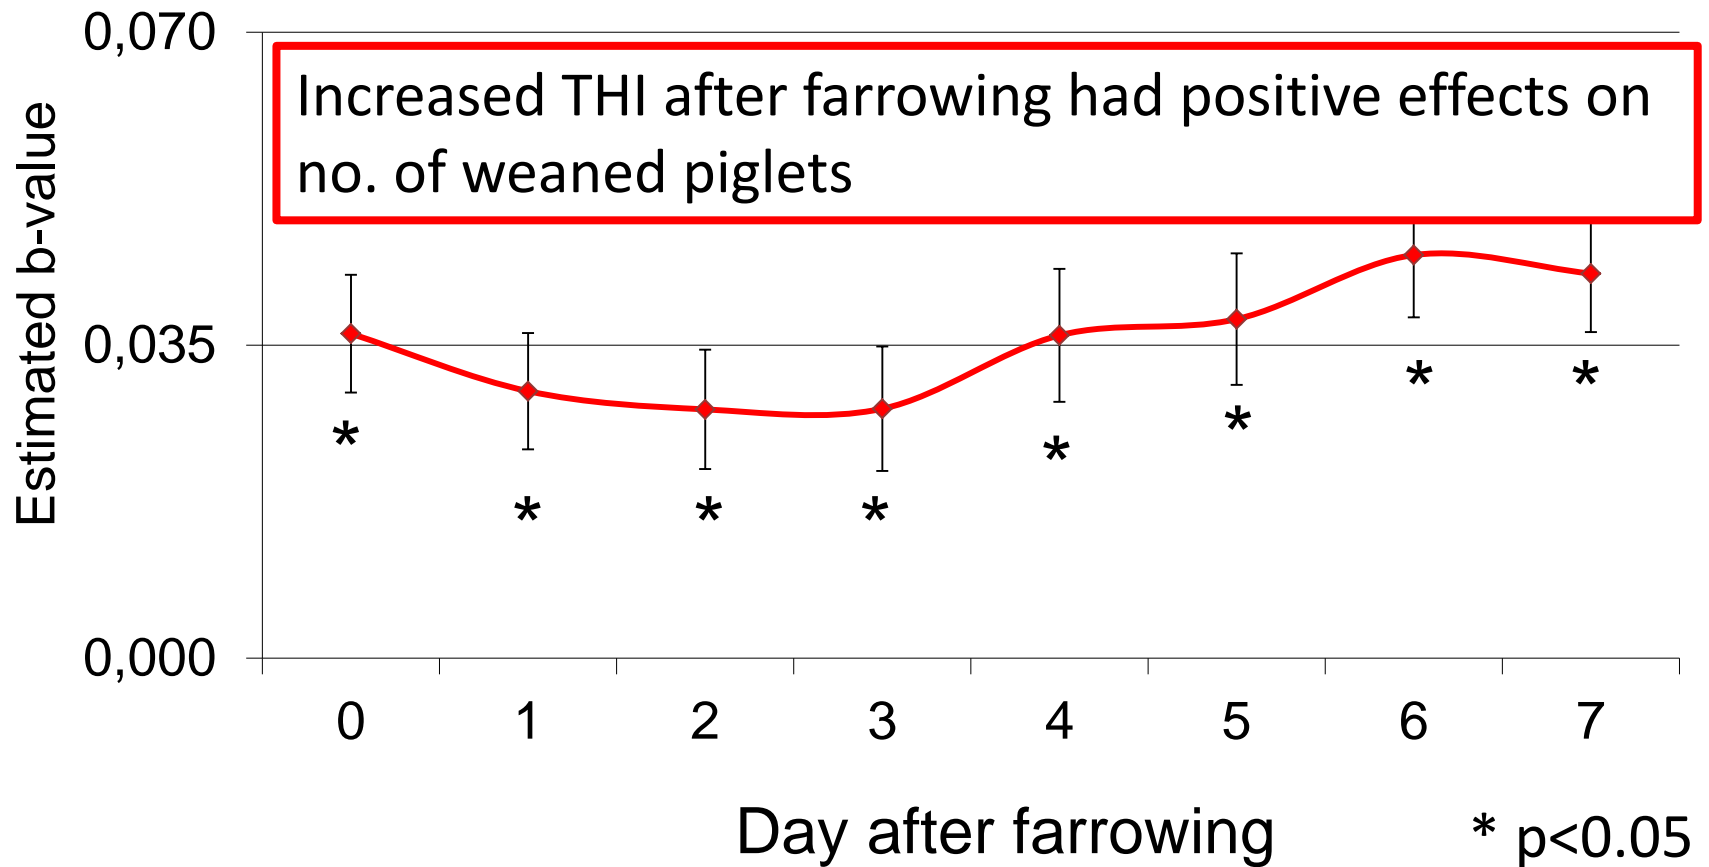

Effect of THI before farrowing on stillborn piglets

* $p < 0.05$

Effect of THI after farrowing on weaned piglets

Effect of THI after farrowing on preweaning mortality

Summary

- THI had effects on the reproductive performance in SOWS
- Sows:
 - Less live born piglets
 - Less stillborn piglets
- Piglets:
 - Increased no. of weaned piglets
 - Lower preweaning mortality

Conclusions

- Piglets' performance increased with higher THI-values
- Higher THI-values negatively affected reproductive performance of the sows at the time of farrowing

We acknowledge:

The studied farms.

und Forschung

Thanks for your attention !

Reproductive performance of the studied farms

(N=6)

Parameter	Mean	Range
Farrowing rate (%)	71	64 - 81
Live born piglets (n)	13.6	13.1 - 14.6
Piglets weaned/litter (n)	11.6	10.9 - 12
Piglets weaned/sow / year (n)	27.8	26.2 - 30
Preweaning mortality (%)	15	9.1 - 18.1
Weaning -to-service interval (d)	5.2	4.7 - 5.5
Returns-to-service (%)	7.7	3 - 14
Replacement rate (%)	46	35 - 62.2
Litters per sow (n)	4.8	3 - 5.7
Lactation days (d)	22.8	19.3 - 27.4

Background

- Heat stress in sows: combination of temp and RH !
- Temperature-humidity index
- Thresholds for heat stress in sows?
- Causes seasonal infertility and decreases reproductive efficiency
- Feed intake reduced by up to 50% (Collin et al., 2001)
- Effects of heat stress greatest during lactation (Williams et al., 2013)
- Different thermal-neutral zones of sows and piglets

Production cycle

- Servicing compartment
 - Single gestation crates until 4 weeks after AI
- Waiting compartment
 - Groups of 10 to 80 sows until 1 week prior to farrowing
- Farrowing compartment
 - Single farrowing crates; weaning after 21 -28 days
