26-30 August 2013

Session 29

Abstract 16977

# Introduction

Stress?!

Suckling order

Rank order

Cross fostering

Weaning/ Rehousing

Contact to humans

Stress is an important factor in the whole pig production

# Introduction

Stress is an important factor in the whole pig production

- Regarding animal welfare aspects the individual pig behaviour becomes more important
- Knowledge about behaviour in standardised stressful situations → Behavioural tests

Backtest

Human approach test

- Improvement of housing conditions
- Implementation in breeding programs

# Aims

- Analysing individual pig behaviour in the backtest and the human approach test
- Estimation of heritabilities ( $h^2$ )
- Relationship between and across behavioural tests ( $r_p, r_g$ )

# Material & Methods- Behavioural test

## Backtest

- 12<sup>th</sup> and 19<sup>th</sup> day of life
- Duration 1 minute
- 1,383 animals
  
- Traits:

Number of escape attempts (NEA)

Duration of escape attempts (DEA)

Latency to the first escape attempt (LEA)

# Material & Methods- Behavioural test

## Human approach test

- 2 x Suckling piglets (n = 1,319)
- 4 x Weaned pig (n = 1,318)
- 1 x Gilts (n = 272)
- Duration 1 minute
- Trait:

Latency to the first contact with the stockperson (LC)

# Material & Methods- Statistics

## Model: Backtest

**NEA** (number of escape attempts): Poisson- Distribution

**DEA** (duration of escape attempts): Poisson- Distribution

**LEA** (latency to escape attempt): Binary- Distribution

### ***Fixed effects:***

- Batch
- Test number

### ***Random effects:***

- Litter
- Animal
- Permanent  
environmental effect

### ***Covariate:***

- Weight at birth

# Material & Methods- Statistics

## Model: Human approach test

$LC_{\text{Suckling piglets, weaned pigs}}$  – Binary- Distribution

$LC_{\text{Gilts}}$  – Normal distribution

	<b><i>Fixed effects:</i></b>	<b><i>Random effects:</i></b>	<b><i>Covariate:</i></b>
$LC_{\text{Suckling piglets}}$	<ul style="list-style-type: none"> <li>• Batch</li> <li>• Test number</li> <li>• Gender</li> </ul>	<ul style="list-style-type: none"> <li>• Animal</li> <li>• Litter</li> <li>• Permanent environmental effect</li> </ul>	-
$LC_{\text{Weaned pigs}}$	<ul style="list-style-type: none"> <li>• Batch</li> <li>• Test number</li> <li>• Gender</li> <li>• Category of the pen</li> </ul>	<ul style="list-style-type: none"> <li>• Animal</li> <li>• Litter</li> <li>• Permanent environmental effect</li> </ul>	-
$LC_{\text{Gilts}}$	<ul style="list-style-type: none"> <li>• Batch</li> </ul>	<ul style="list-style-type: none"> <li>• Animal</li> <li>• Litter</li> </ul>	<ul style="list-style-type: none"> <li>• Weight at rehousing</li> </ul>

# Results- Backtest

Heritabilities (diagonal), genetic correlations (above diagonal) and phenotypic correlations (below diagonal) of backtest traits

	<b>NEA</b>	<b>DEA</b>	<b>LEA</b>
<b>NEA</b> (number of escape attempts)	<b>0.19</b>	0.99	n.c.
<b>DEA</b> (duration of escape attempts)	0.73	<b>0.10</b>	-0.99
<b>LEA</b> (latency to escape attempt)	n.c.	-0.64	<b>0.18</b>

n.c. not converged

# Results- Human approach test

Heritabilities (diagonal), genetic correlations (above diagonal) and phenotypic correlations (below diagonal) of the trait latency (LC) of human approach tests with suckling piglets, weaned pigs and gilts

	<b>LC<sub>Suckling piglets</sub></b>	<b>LC<sub>Weaned pigs</sub></b>	<b>LC<sub>Gilts</sub></b>
<b>LC<sub>Suckling piglets</sub></b>	<b>0.07</b>	0.75	-0.06
<b>LC<sub>Weaned pigs</sub></b>	0.18	<b>0.17</b>	0.36
<b>LC<sub>Gilts</sub></b>	0.00	0.17	<b>0.58</b>

# Results- Correlation

Phenotypic ( $r_p$ ) and genetic correlations ( $r_g$ ) between backtest traits and the trait latency (LC) of the human approach test with suckling piglets, weaned pigs and gilts

	<b>LC<sub>Suckling piglets</sub></b>		<b>LC<sub>Weaned pigs</sub></b>		<b>LC<sub>Gilts</sub></b>	
	<b><math>r_p</math></b>	<b><math>r_g</math></b>	<b><math>r_p</math></b>	<b><math>r_g</math></b>	<b><math>r_p</math></b>	<b><math>r_g</math></b>
<b>NEA (number of escape attempts)</b>	-0.08	-0.84	-0.03	0.01	-0.01	-0.06
<b>DEA (duration of escape attempts)</b>	-0.07	-0.90	-0.03	0.00	-0.03	-0.21
<b>LEA (latency to escape attempt)</b>	0.15	0.94	0.07	0.25	0.05	0.10

# Discussion

- **Medium heritabilities of both behavioural tests ( $h^2 = 0.07 - 0.58$ )**
  - Backtest: Velie et al. (2007):  $h^2 = 0.31 - 0.53$
  - Human approach test: Hemsworth et al. (1990):  $h^2 = 0.38$
- **Very high genetic ( $r_g = 0.99$ ) and phenotypic ( $r_p = -0.64 - 0.73$ ) correlations between backtest traits**
  - Regarding time effort and standardisation it is sufficient to record only number of escape attempts (NEA)

# Discussion

- **Higher genetic and phenotypic correlation between human approach tests with smaller time differences**
  - Behaviour in tests depends on age of animals  
(effect of habituation)
- **No/ small genetic and phenotypic relation between backtest and human approach tests**
  - Behaviour of pigs in the different tests depends on different genetic effects
- 6 Exception: High genetic correlation between backtest and human approach test with suckling piglets → Trait with small frequency and small heritability

# Thank you for your attention!
