

Frequently recorded sensor data may correctly provide health status of cows

*If data is handled carefully and errors are
filtered away ...*

Gadgets on the dairy farm

Why use sensors?

Fact:

An increasing number of dairy farms use sensor technology

Reasons:

- More cows – loss of perspective
- Labor reduction
- Better detection of estrus/diseases
- Better milk quality (increased income)
- Cost reduction (in the long run)
- Optimization
- Clever sales person!
- **Improve decision making**

Aim of this talk

- **To demonstrate how a sensor has potential to improve decision making**
- **The OCC sensor taken as example**
- **Does the sensor work as promised?**
- **How to interpret raw data – if possible at all?**
- **What kind of messages are needed?**
- **Potential use outside the dairy farm**
- **Role in genetic evaluations?**

So we got the OCC installed...

OCC output (raw measurements)

General	Counter (Teat level)				OCC(*1000)	
Animal Number	LF	RF	LR	RR	OCC (*1000)	Date
1125	0	0	1	0	100	2006-10-18
1198	0	0	0	1	20	2006-10-18
864	0	0	0	0	25	2006-10-18
945	0	0	0	0	23	2006-10-18
997	0	0	0	0	19	2006-10-18
976	0	0	0	0	150	2006-10-18
1013	0	0	0	0	2455	2006-10-18
1030	0	0	0	0	42	2006-10-18
1071	0	0	0	0	17	2006-10-18

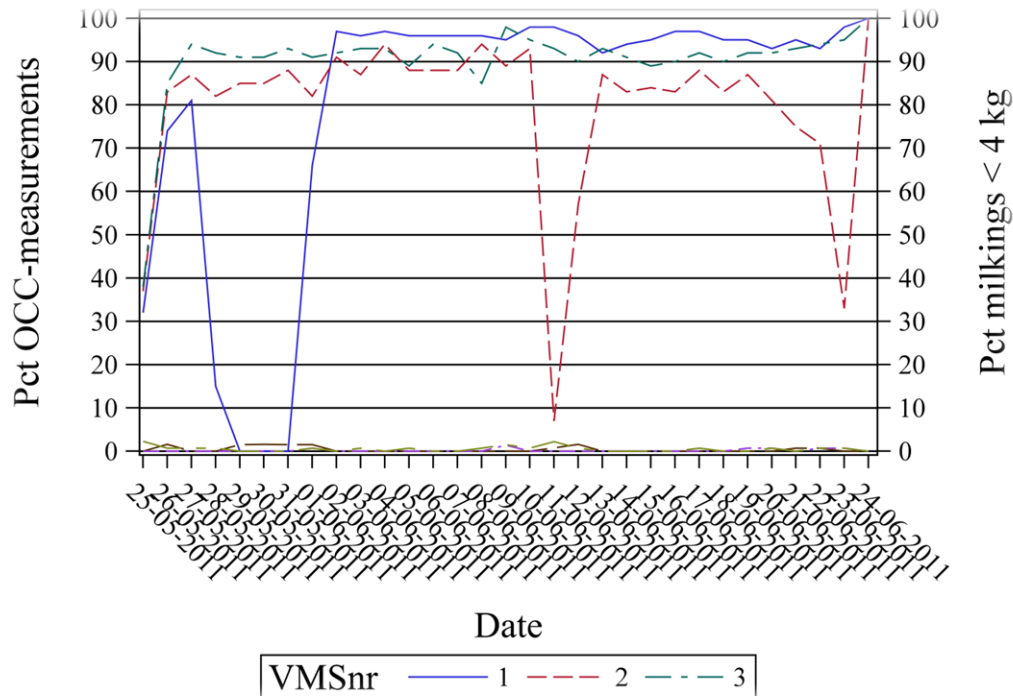

But what about this one?

We need to check this cow

Issue: Difficult to make decision from one value - and there are other problems!

Sensor monitoring

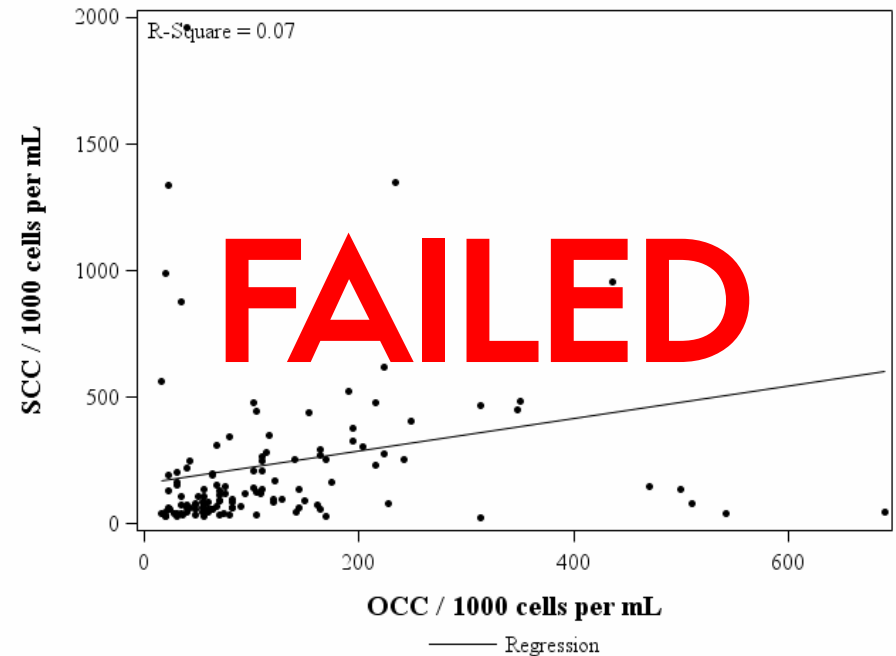

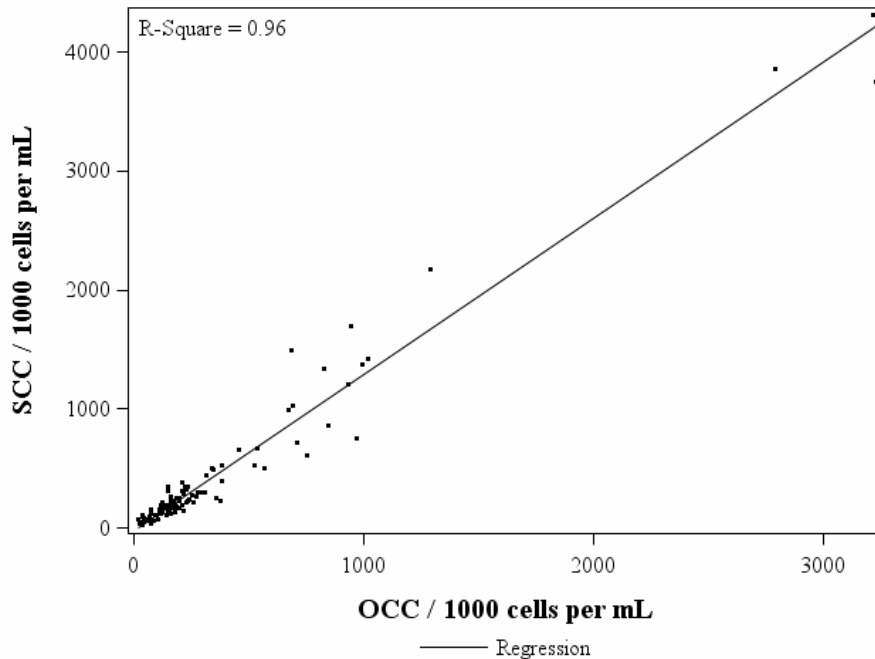

- Is the device running? Failures are expected!

- Is the device measuring correctly?

First requirement – reliable data

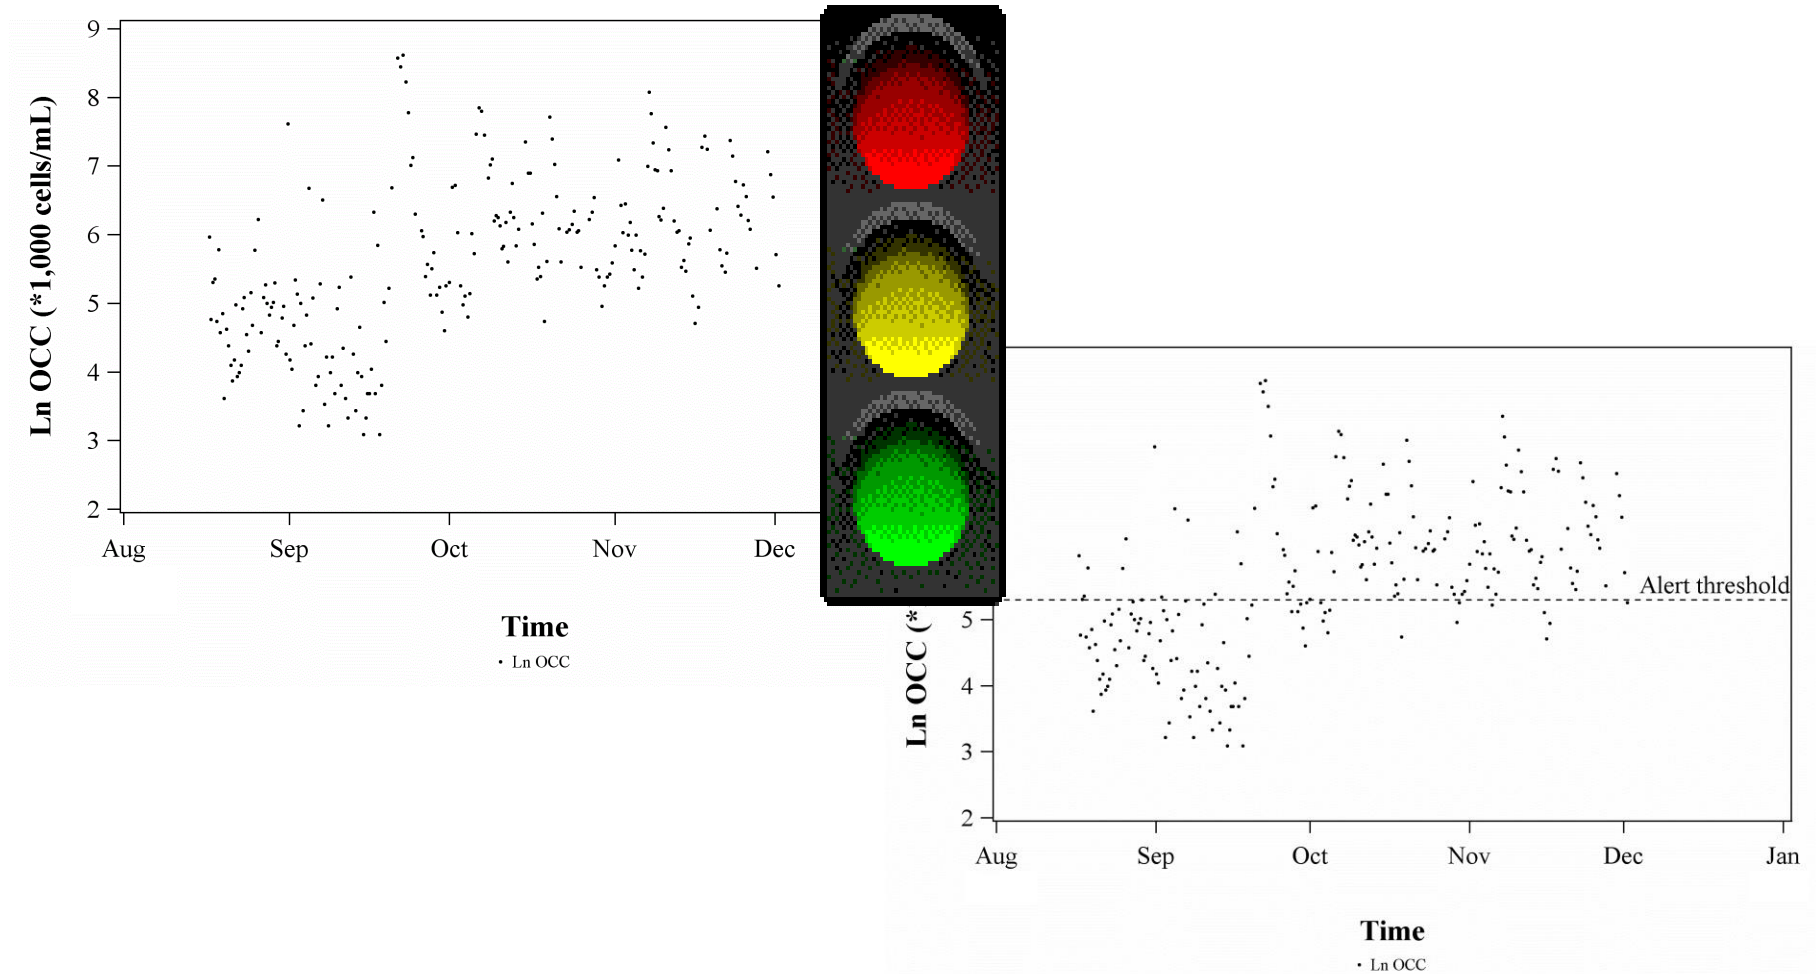

- Are the measurements correct?
- Compare against gold standard – test-day SCC

Requirement: monitoring module

Data: noise or signal ?

Cow 653

Filtering and standardisation

- **Fixed filter to take out obvious errors**

- Zero readings → "missing" / omit and repair
- Extreme values → detection ? / omit and repair
- Fixup routine → get the process going again – fast

- **Time series approach to monitor instrument:**

Weighted exponential smoothing

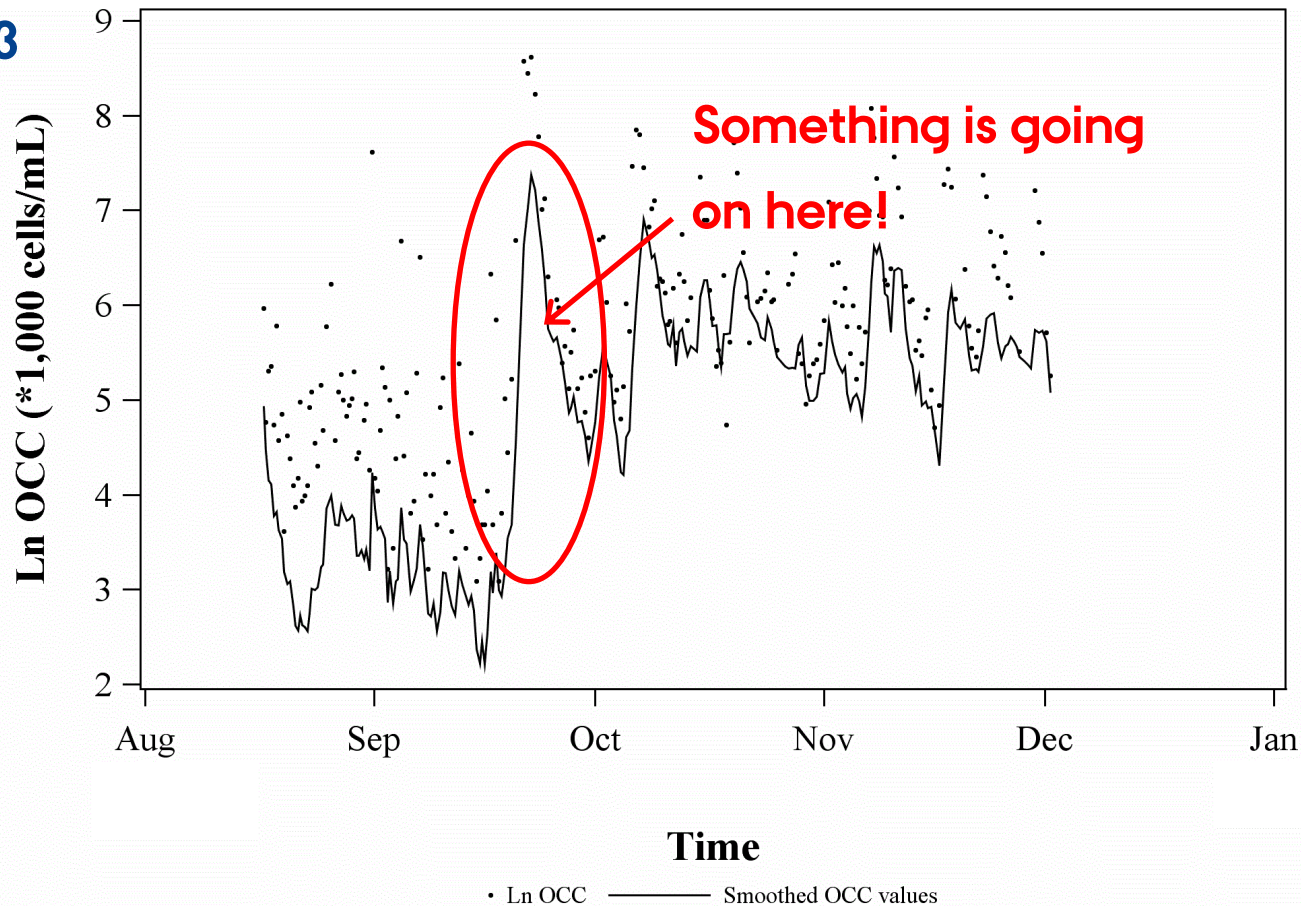

$$s_t = (1 - \alpha)s_{t-1} + \alpha y_t \quad \alpha \text{ is the smoothing constant}$$

Time series were also applied to each cow

OCC model - noise reduction

- Standardization and smoothing of data

Cow 653

OCC model – unusual data

- **Filtering of very low OCC values**
 - Likely measurement error
 - May result in false positive alerts
- **Dealing with missing measurements**
 - No data → bad update = no new info
 - Gradual increase (or decrease) of OCC values

Ready to use data - focus on the cow

Elevated mastitis risk

From smoothing we get **OCC level** and **trend** →
calculate Elevated Mastitis Risk (EMR)

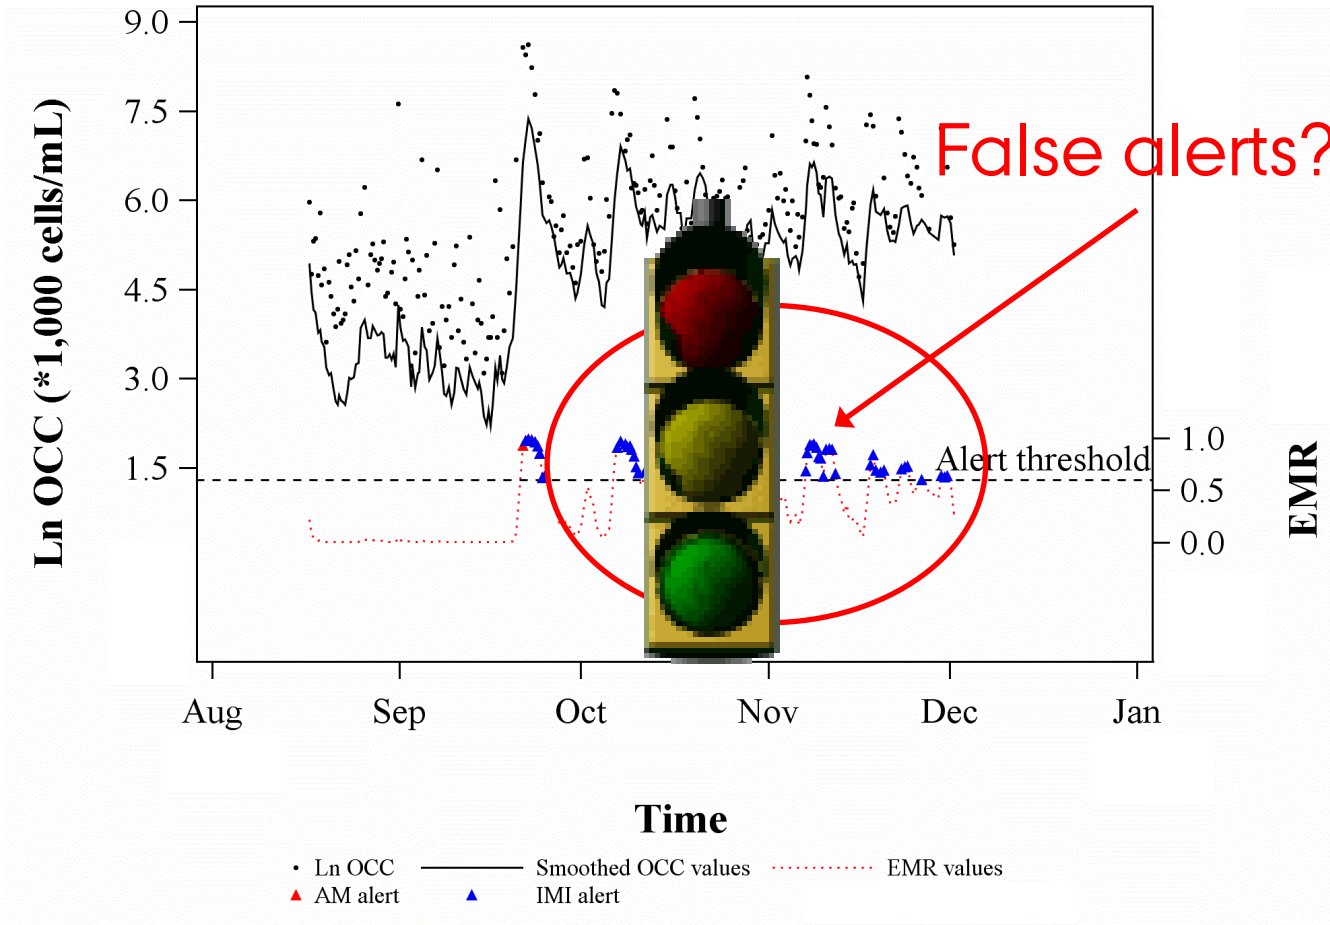

- Simple alert based on EMR threshold

Acute alert

OCC model – simple alerts

Cow 653

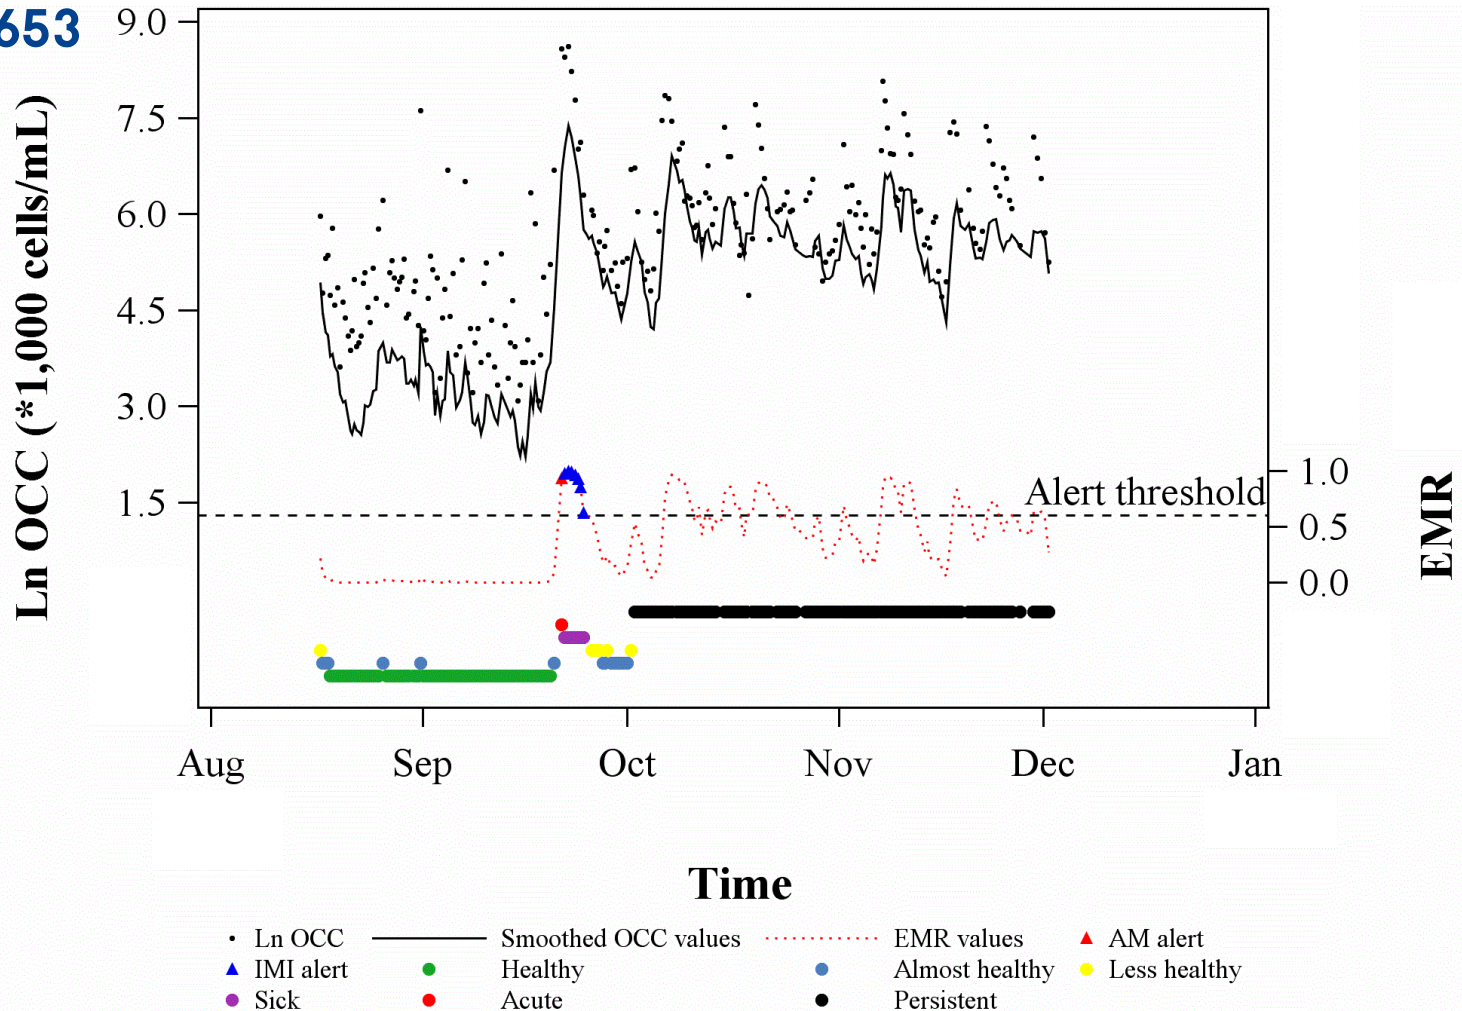

Advanced alert system

- **Mastitis can be graduated → EMR**
- **Persistent IMI cause "false alerts"**
 - Fluctuating pattern → increased OCC variation
- **New definition of persistent IMI**
 - Threshold for OCC variance
 - 10-15 days delay from onset
- **Additional health class**
 - Advantage: All cows in the herd are assigned to a health class

OCC model – advanced alert system

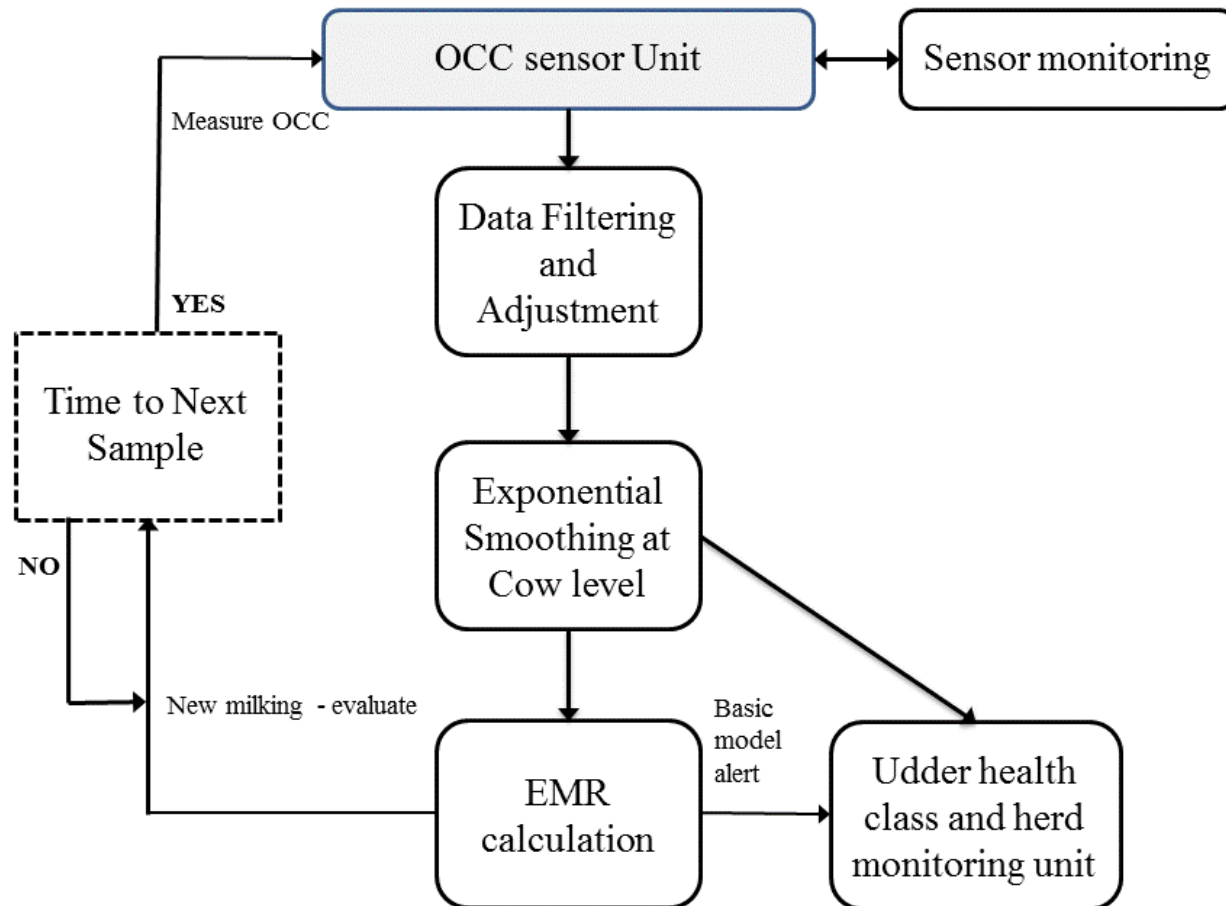

Cow 653

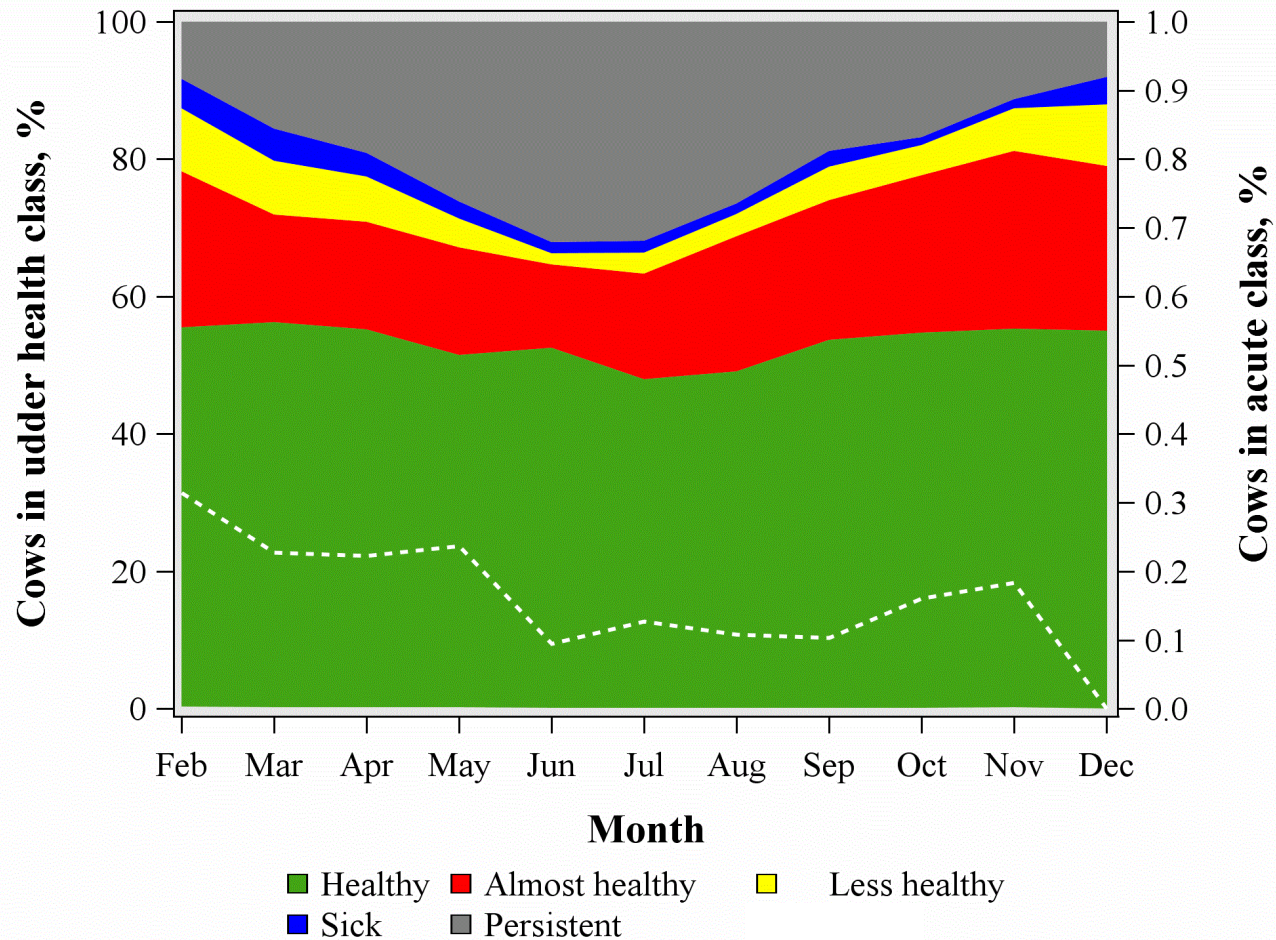

Persistent IMI – another example

OCC IMI detection system

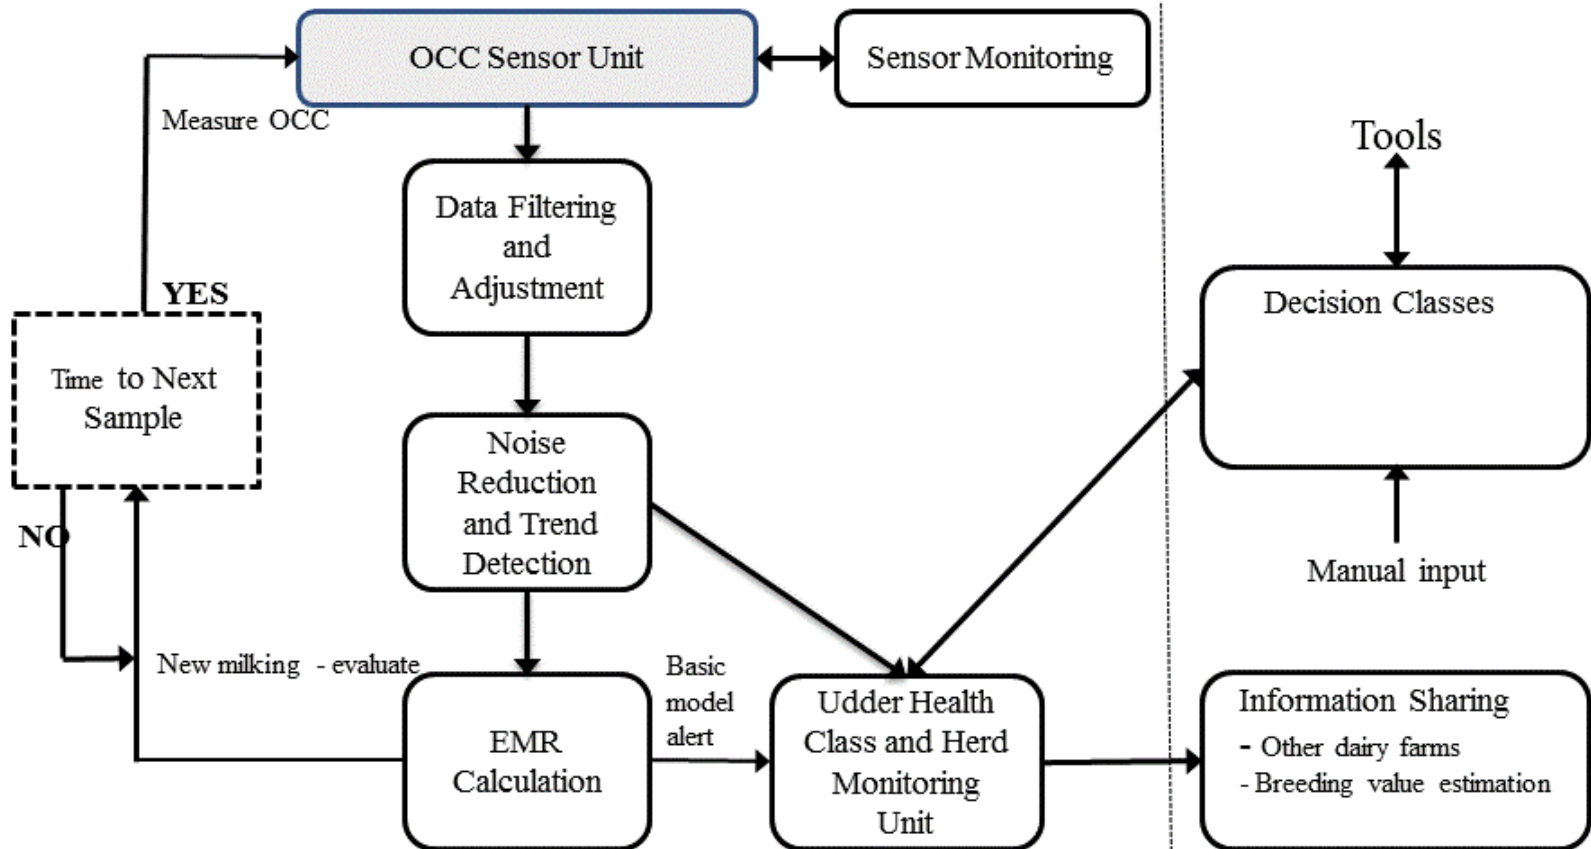

Udder health monitoring – herd level

Verification of sensor alerts

- **Available gold standard for comparison?**
- **Gold standards: mastitis treatments, PCR, SCC**
- **Longitudinal study period**
 - Relatively easy – gold standard may already be available
 - Disadvantage: No udder health status on “non-treated” cows
- **Cross-sectional study**
 - Udder health status on all cows according to chosen gold stand.
 - Few “treated” cows
 - Disadvantage: costly – especially in AMS herds – manual sampling required

Potential use of OCC output

So far - conclusions

- **Filtering + calculations → more useful for decision support**
- **Sensor check is crucial**
- **Clear signal is suitable in decision support**
- **Enables monitoring at cow and herd level**
- **Potential for data sharing**
- **Do we need official test procedures for sensors? Role of ICAR?**

Then, what about genetics?

- **Many sensor systems – agreement on what biological trait to be expressed ?**
- **Or better - integrate over a number of systems recording different aspects or details**
- **Combine with traditional traits – recorded in many animals**
- ***The key is to obtain an improved phenotype!***

Thanks ...
