

# INNOVATION IN LIVESTOCK PRODUCTION: FROM IDEAS TO PRACTICE

LOCAL INDUSTRY DAY

# Genomic selection in practice: Application and uses in the U.S. dairy industry

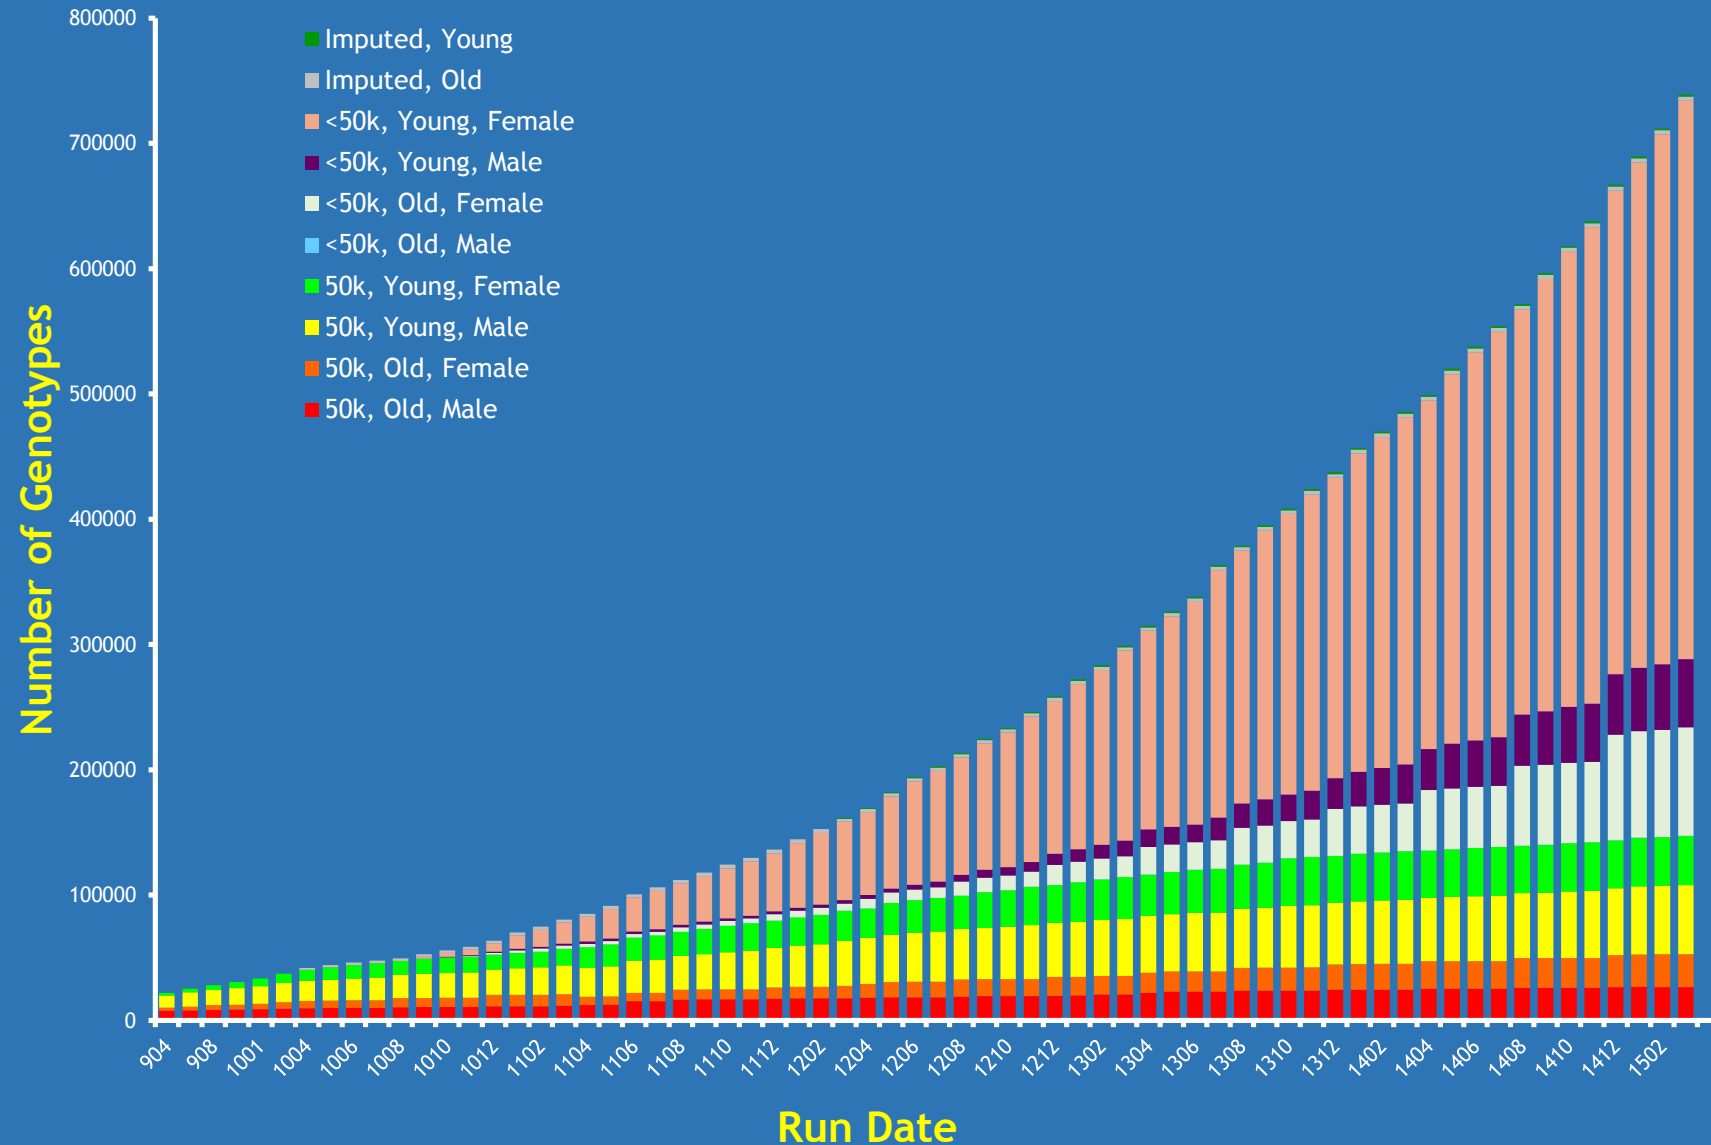

Dr. Tom Lawlor, Holstein USA

# Genomic information

Has revolutionized the dairy cattle breeding industry.

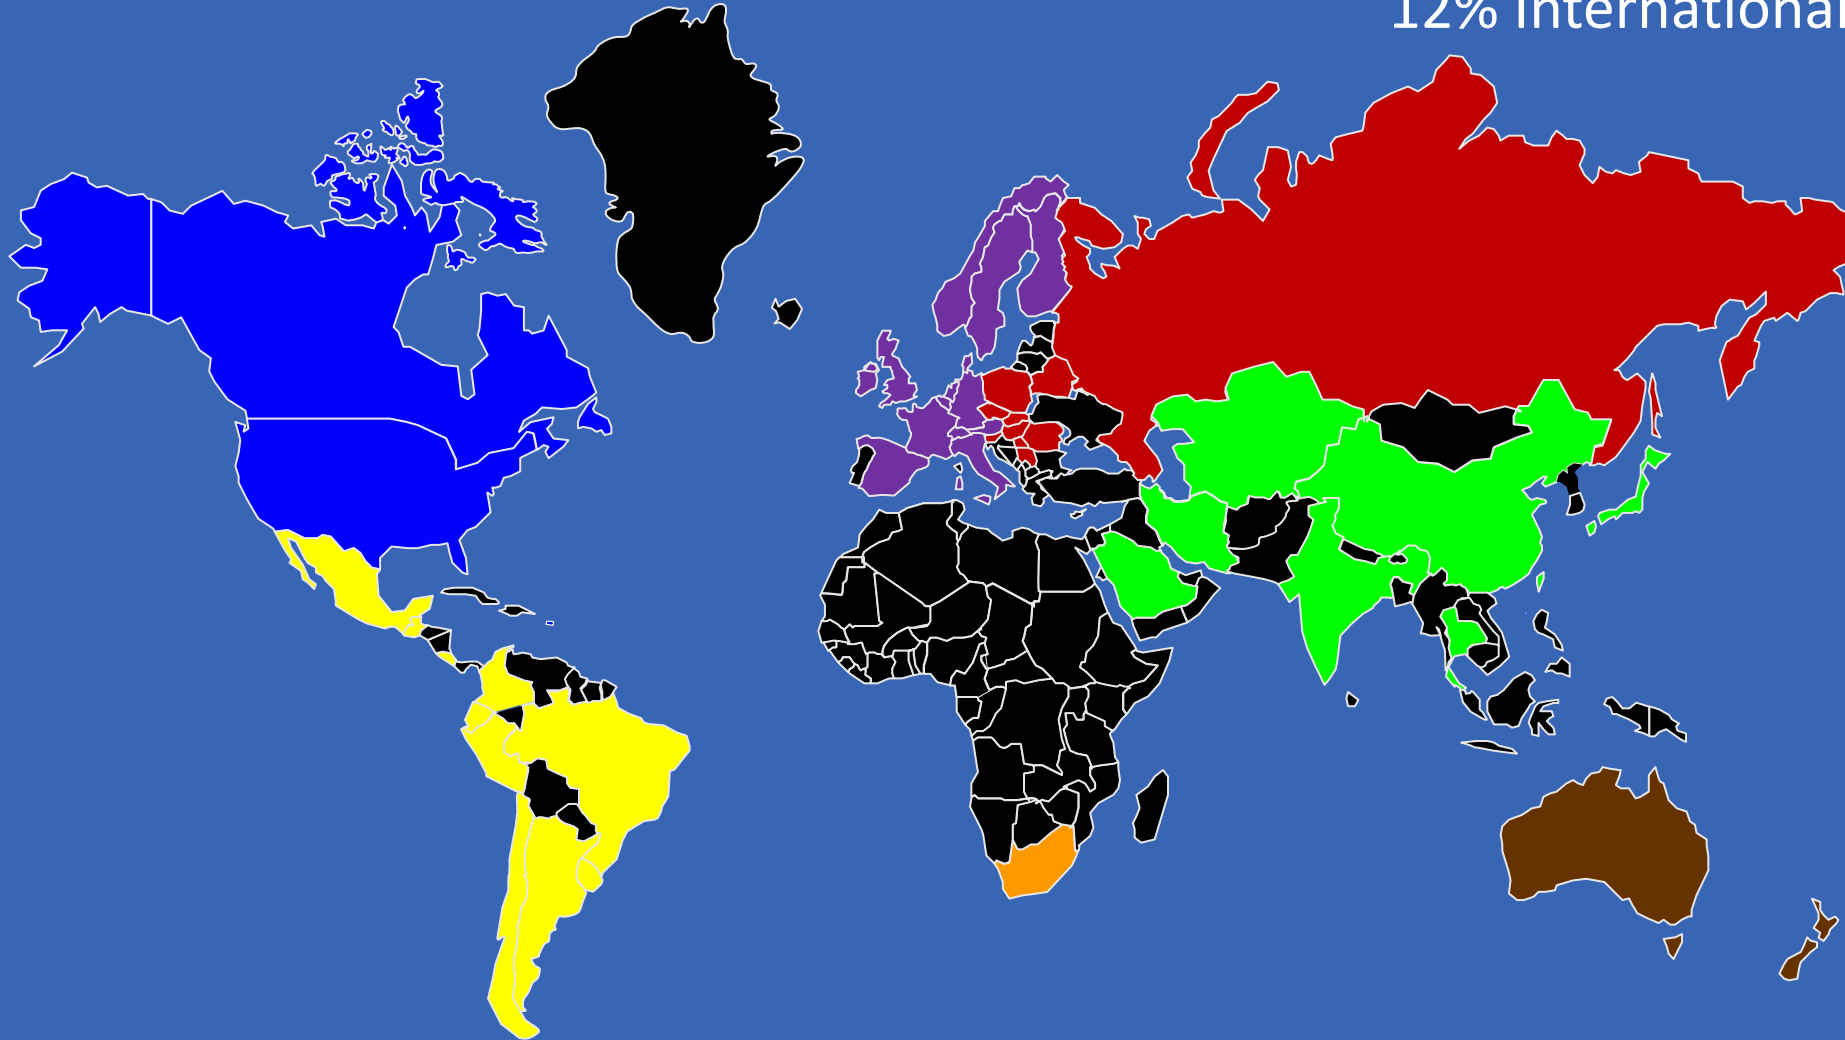

# Genomic testing continues to grow in popularity

# Genotype Contributors by continent

Over 1 million animals genotyped.

77% from USA,  
11% from Canada,  
12% International

# How we're using **genomics** within the Holstein breed.

- Determine the **genetic merit** of elite animals at a young age.
- **Herd Management**, cull low end replacement animals earlier, breed lower genetics to beef bulls.
- Verify or discover **Parentage**.
- Identify **Breed composition** of crossbreds.  $\frac{1}{2}$  HO,  $\frac{1}{4}$  HO, etc.
- Track **haplotypes** or **single genes**.
- Manage the rate of **Inbreeding**.
- Having more animals genotyped allows us to more easily **investigate** other genetic issues.

# Determine Genetic Merit

# Progeny Testing

Distribute semen across the country.

Goal: Get 120 daughters in 80 herds

Bull is 5 years old by the time you know how good he is.

## Before having Genomic Predictions

We would predict a the bull's average Transmitting Ability for a trait like Lifetime Net Merit.

PTA NM\$ is \$660

On average his offspring should produce \$660 more profit than a breed average cow

DNA isn't transmitted as ONE long piece it's transmitted in sections called chromosomes

Chromosomes frequently break and recombine.

With genomic testing, we're now able to track the inheritance of chromosome segments with the use of genetic markers.

The genetic Markers (SNPs)

GATTCA**A**CGCT**T**ACTG**T**TTCA**C**TGGA

# *Track haplotypes (sections of DNA) over time*

**Chromosome 15**

We can estimate the **value of each section of an animal's genome** for a variety of traits

## Fat Yield

Distribution of marker effects for HO Fat (1508 run)

## Cow Conception Rate

Distribution of marker effects for HO Cow\_Conc\_Rate (1508 run)

Genomic Prediction tells us, how his genetic merit will be transmitted.

Chromosomal PTA for NM\$

## With Genomics:

*We're able to determine if an offspring received  
**good** or **bad** alleles from its parents*

chromosome  
from her **sire**

chromosome  
from her **dam**

Polygenic: genetic variation not explained by markers

# A top daughter of **this bull**

Net Merit	<b>\$702</b>
<b>Sire</b>	<b>\$381</b>
<b>Dam</b>	<b>\$296</b>
Polygenic	<b>\$25</b>

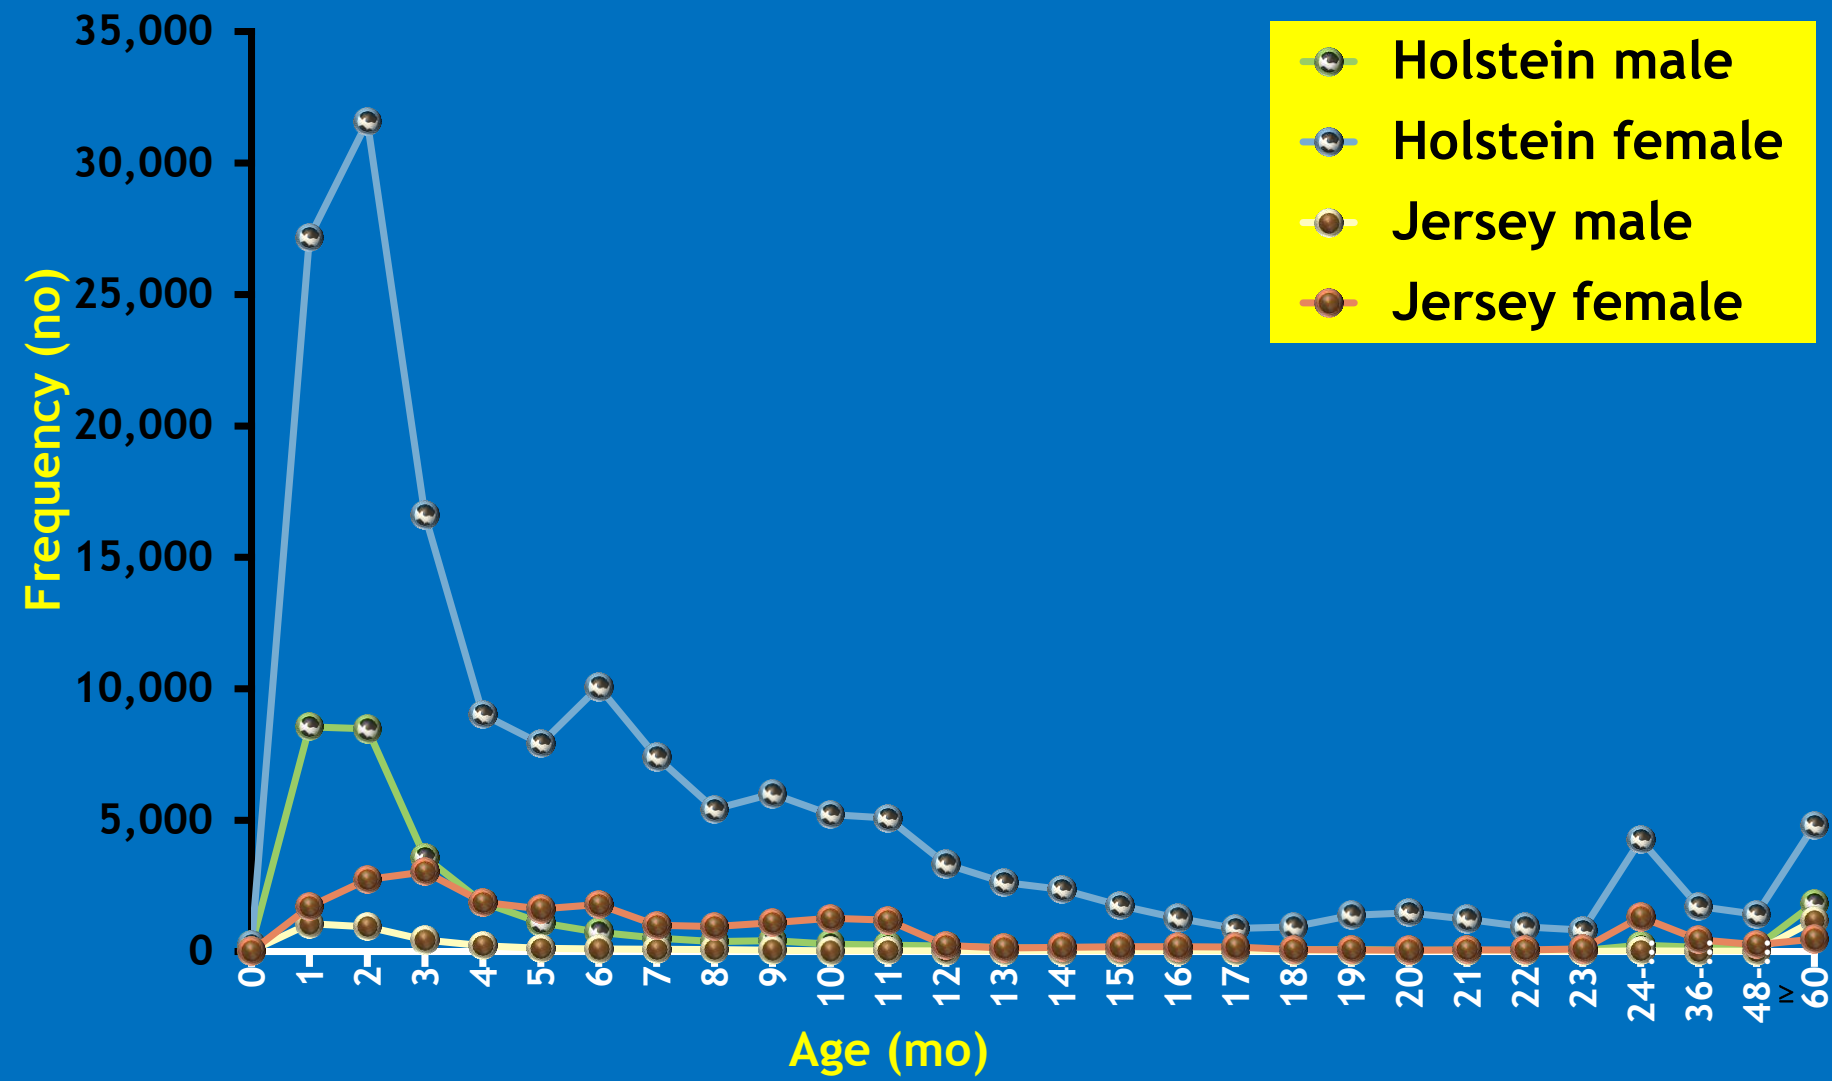

chromosome  
from her **sire**

chromosome  
from her **dam**

Polygenic: genetic variation not explained by markers

Most animals are being tested at less than 4 months of age

## Two main reasons

- Selection of superior breeding stock - elite animals
- Early identification of animals that should be culled.

# Genetic Gain per Year

$$\Delta g = \frac{ri\sigma}{L}$$

$$\frac{(\text{Accuracy} \times \text{Intensity} \times \text{Genetic Variation})}{\text{Generation Interval}}$$

What we want to do.

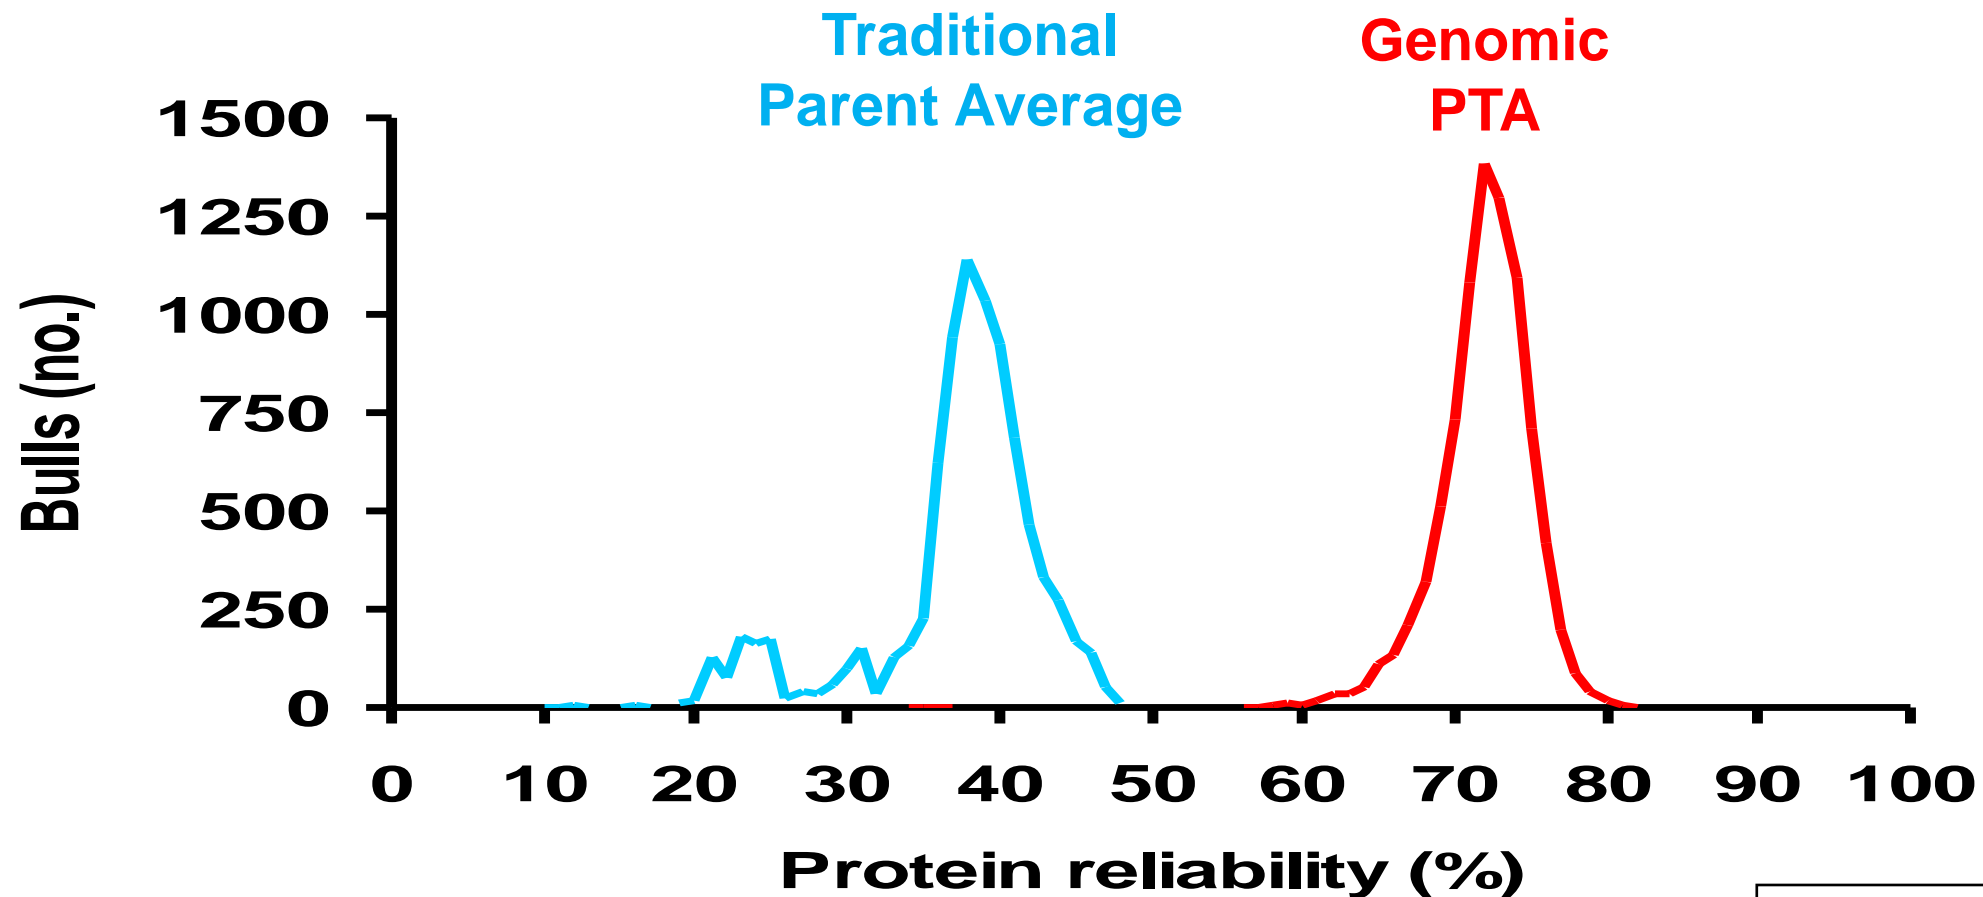

↑ Accuracy by using genotypic data

↑ Select more intensely

↓ Generation interval by obtaining evaluations earlier in life

A genomic test gives you a more accurate prediction of genetic merit

## Reliabilities for Young Animals

$$\text{Accuracy} = \sqrt{\text{reliability}}$$

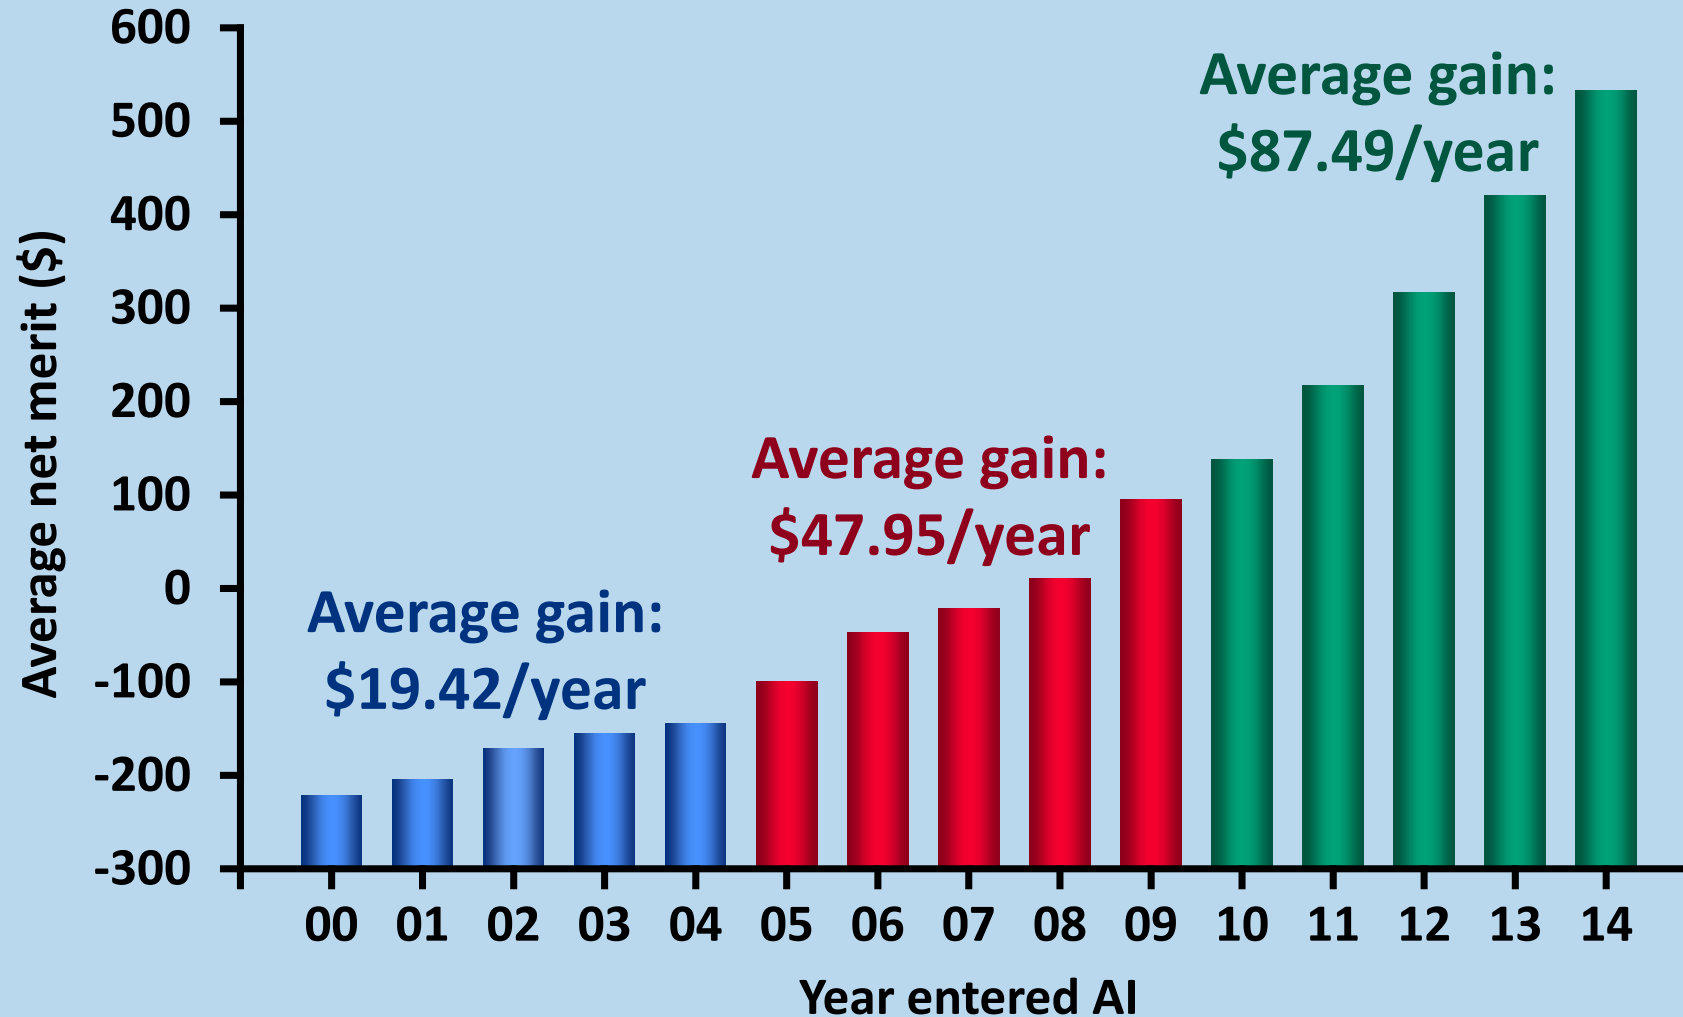

# Generation Interval

Age of <b>Parents</b> when he was born	Age of <b>Grand Parents</b> when his parents were born	Age of <b>Great Grand Parents</b> when Grand Parents were born	Age of <b>Great Great Grand Parents</b> when Great Grand Parents were born
<b>20</b> months	<b>22.5</b> months	<b>33.8</b> months	<b>62.1</b> months

# Genetic merit of marketed Holstein bulls

*improving at a faster rate*

# Better Herd Management

# Heifer selection with genomic testing

“We have to continually ask ourselves, ‘How can we become more efficient?’ ‘How can we maximize profits?’ and ‘How can we improve the quality of our animals?’”

Chaput Family Farms, North Troy, Vt.

# Early identification of elite animals and ones that should be culled or bred to a beef bull.

**Welcome Stock Farm - Schuylerville, NY**

# Example of 1 days worth of DNA samples from 1 large commercial farm

Source: Paul VanRaden, USDA

# 46 US Holsteins - unknown parents

Genetic Merit for NM\$

*You know nothing about their Genetic Merit for lifetime profitability (NM\$)*

Without any pedigree information, they all **appear the same!**

# 46 US Holsteins - genotyped

Genetic Merit for NM\$

*Change in Genetic Merit for NM\$ after  
genotyping*

# The poorest animals can be culled

**If we cull the lowest 10**

**Average of the remaining ones is  
+\$99.2 higher**

Genetic Merit for NM\$

# Study done by University of Wisconsin

Genomic predictions are much more accurate than just using the Sire's PTA.

Leading to more accurate culling decision.

**Table 2. First lactation ME 305-day milk yield based on sire's PTA milk**

Quartile	Number of cows	Average sire PTA milk ( lbs.)	Actual ME 305-day milk yield (lbs.)
Top 25%	103	1,780	29,864
Top 25-50%	103	1,168	29,673
Bottom 25-50%	103	762	29,247
Bottom 25%	102	128	27,498

Spread  
29,864  
– 27,498  
= 2366

**Table 1. First lactation ME 305-day milk yield based on genomic PTA milk**

Quartile	Number of cows	Average genomic PTA milk (lbs.)	Actual ME 305-day milk yield (lbs.)
Top 25%	103	1,358	31,581
Top 25-50%	103	832	30,050
Bottom 25-50%	103	482	27,864
Bottom 25%	102	-57	26,780

Spread  
31,581  
– 26,780  
= 4801  
pounds  
of milk

# Genomic testing allows farmers to jump ahead of the competition !

# Many herds are interested in Parentage verification and discovery

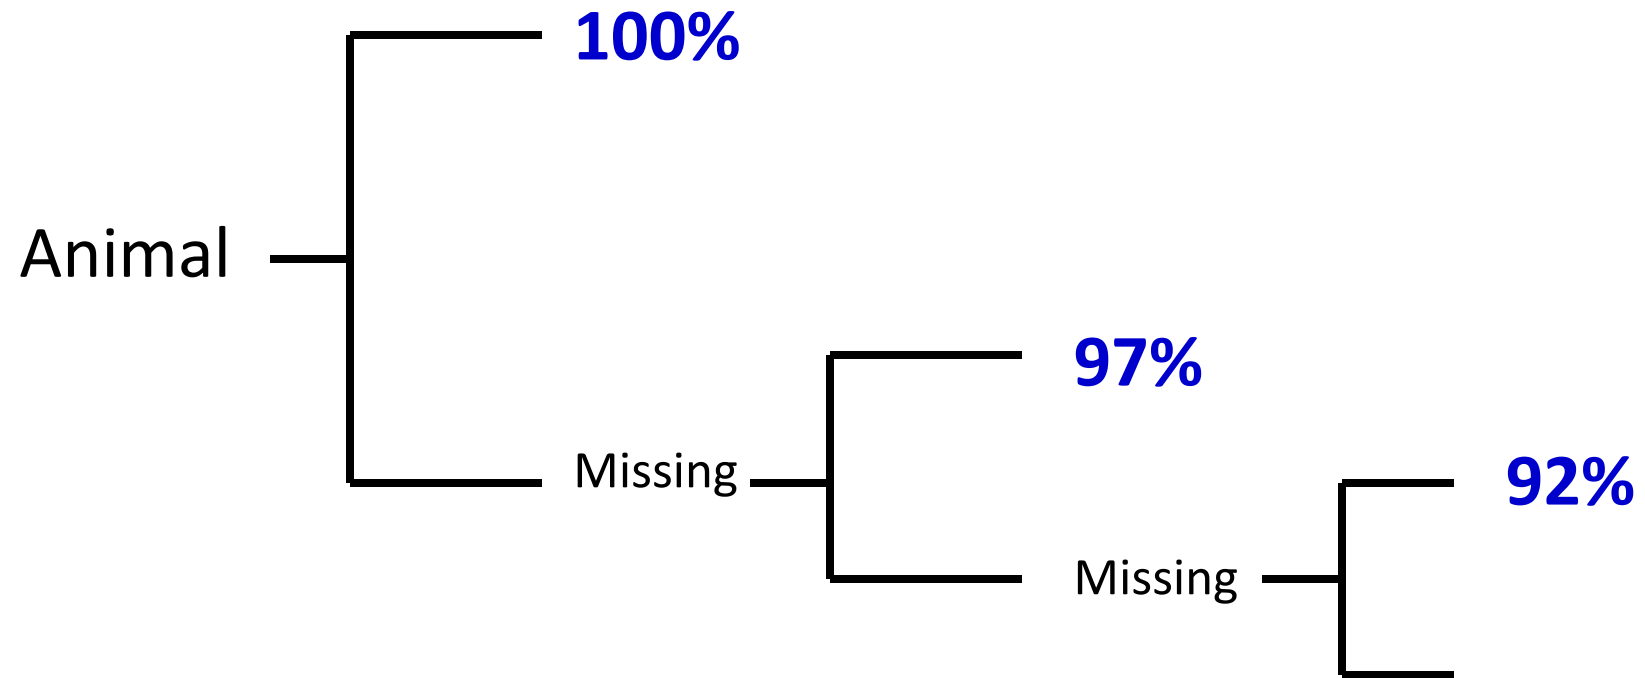

*Who's your daddy?*

We can often identify the sire of the animal

# Probability of finding a missing relative

When the bull has been genotyped.

# Sire can be verified

## Confirmed, Corrected or Discovered

	Verified	Not Found
North America	95.8	4.2
Western Europe	91.9	8.1
Eastern Europe	90.7	9.3
Oceania	73.2	26.8
Latin America	77.8	22.2
Asia	71.4	28.6
Africa	95.6	4.4

# New molecular tools are helping us identify the effect of single genes.

- As more animals are genotyped, new crossovers occur, which allows us to narrow down the affected DNA area segment.
- Mapping the defect to a small section of DNA.

part of the original chromosome

# Use sequence data to find causative mutation

## HH1 – Holstein Haplotype 1

- Exact mutation found.

CGA → arginine

**T**GGA → **stop** making this protein

- APAF1 gene is important for normal embryonic development (*apoptosis*).
- HH1 is a Loss-of-Function mutation and it's lethal.

AIP RESEARCH REPORT  
GENOMIC3 (09-13)  
Updated Mar. 23, 2015

## Haplotype tests for recessive disorders that affect fertility and other traits

*J.B. Cole, P.M. VanRaden, D.J. Null, J.L. Hutchison, T.A. Cooper, and S.M. Hubbard*

Animal Improvement Program, Animal Genomics and Improvement Laboratory, Agricultural Research Service, USDA, Beltsville, MD 20705-2350

Haplotype Code	Description
0	Non-carrier: free of HCD
1	Carrier: haplotype confirmed with pedigree information
2	Homozygous: confirmed on both sides of pedigree
3	Suspect carrier: haplotype origin could not be confirmed from pedigree
4	Suspect homozygous: probable carrier and may be homozygous; origin of haplotypes could not be confirmed from pedigree

# Identification and Management of Deleterious Mutations

- New molecular tools has made it easier to identify and manage undesirable genetic characteristics.
- We no longer eliminate superior animals that have an undesirable genetic conditions.
- We use breeding tools to avoid carrier to carrier matings.
- Each generation - selective breeding and testing is used to lower their frequency.

# Undesirable haplotypes increase in frequency because they're usually connected to a number of desirable alleles

HCD

New undesirable  
genetic condition

Haplotype associated with  
Cholesterol  
Deficiency

# Lowering the rate of increase in inbreeding

- With any fast improving selection program, we are going to see an increase in inbreeding as we bring the better genes in the population together.
- We especially see this within the mating of the most elite animals
- It's recommended that you choose amongst 5 elite bulls and make a balanced decision between the TPI-adjusted for inbreeding and the actual genomic inbreeding value listed.
