# A genome wide association study for Bovine Digital Dermatitis using M-stages

G. Kopke, R. Jungnickel, H. Dressel, B. Waurich, M. Wensch-Dorendorf,  
F. Rosner, H.H. Swalve, D. Döpfer

[Grit.Kopke@landw.uni-halle.de](mailto:Grit.Kopke@landw.uni-halle.de)

67th Annual Meeting of the European Federation of Animal Science

Belfast UK, 29 Aug 2016, Session 12

# Background

## Bovine Digital Dermatitis (BDD)

(=Pappillomatous Digital Dermatitis/ Hairy Heel Warts)

- infectious claw disease with global distribution
  - multifactorial etiology -> also host genetic factors could play important role (Scholey *et al.*, 2012)
  - different Cow Types regarding the susceptibility to BDD (Döpfer *et al.*, 2004)
  - cows seem to differ in their immune response against *Treponema spp.* (Gomez *et al.*, 2014)
  - $h^2$  based on M-stages: 0.13 – 0.52 (Schöpke *et al.*, 2015)
- identification of chromosomal region(s) contributing to a cow's resistance against BDD, or affecting the course of disease

# M-scale system

**M0**

**M1**

**M2**

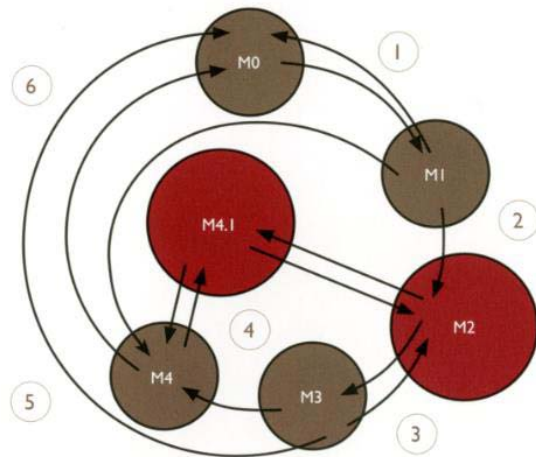

**M3**

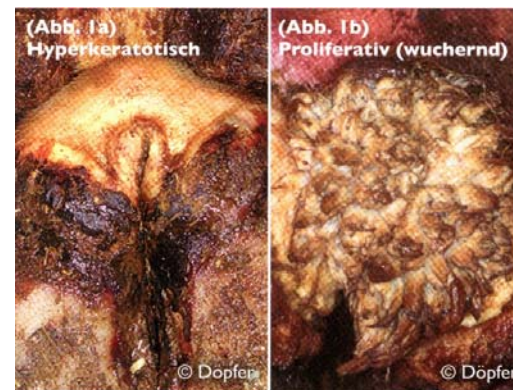

**M4**

**M4.1**

BDD-cycle

signs of chronicity:

- 0: none
- 1: hyperkeratosis
- 2: proliferation

# M-scale system

- M0
- M2 – 0
- M2 – 1
- M2 – 2
- M4 – 1
- M4 – 2

← scored M-stages and signs of chronicity

signs of chronicity:  
0: none  
1: hyperkeratosis  
2: proliferation

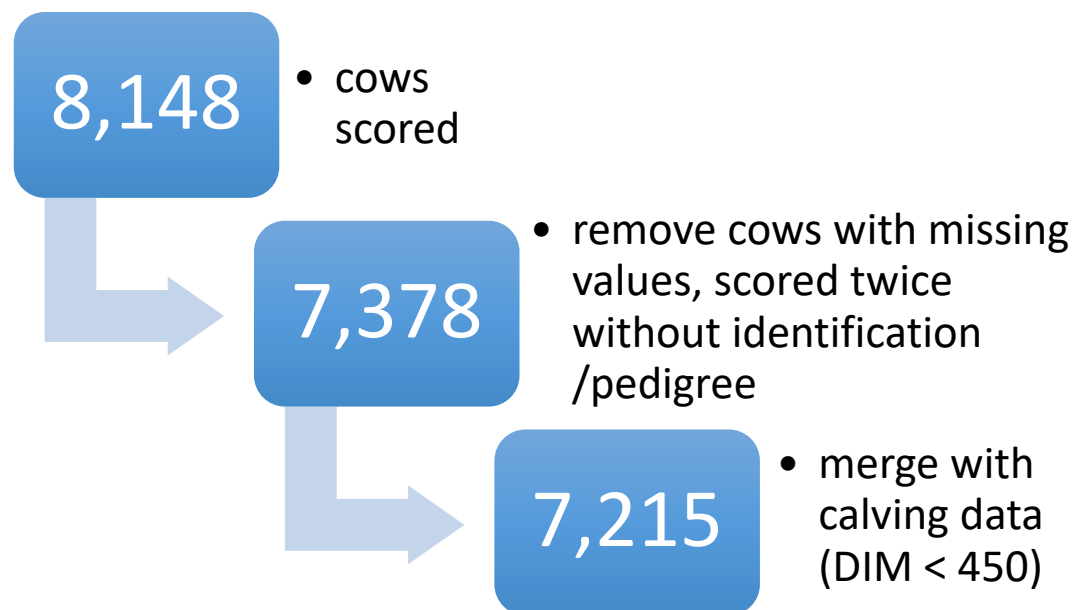

# Main features

- 7 farms in northeast Germany between October 2015 and April 2016
- > 8,000 cows scored for stages of BDD, 3 times at intervals of 3 weeks
- scoring:
  - with DD Check App (Zinpro 2015)
  - rotary milking parlour (external rotary, herringbone, side-by-side)
  - 1 score per cow (hind legs)
  - both legs affected → more severe lesion documented

# Data edition (1)

## scoring data (BDD project)

# Data edition (1)

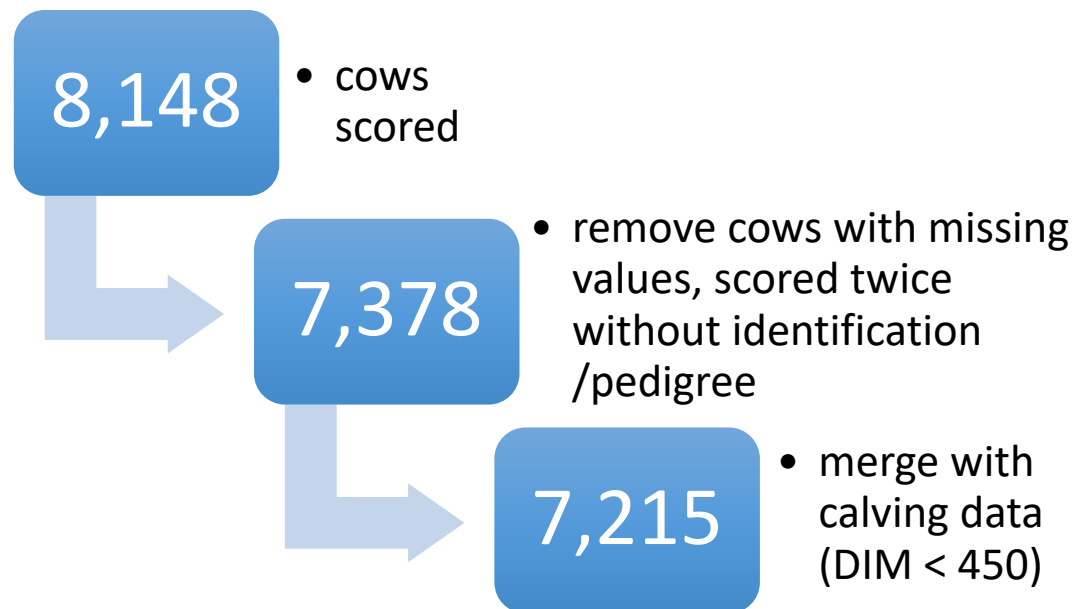

number of observations per cow (N=7,215)

number of obs.	frequency	percent
1	985	13.65
2	1353	18.75
3	4877	67.60

distribution on farms (N=6,230)

farm	N cows	frequency M2
1	1161	4.18%
2	635	25.11%
3	1845	2.01%
4	1147	1.80%
5	528	5.35%
6	348	4.51%
7	566	6.28%

## scoring data (BDD project)

# Data edition (2)

## genotype data (Kuh-L project)

19,166

4,960 50K

14,206 10K  
imputed to  
50K

## scoring data (BDD project)

8,148

- cows scored

7,378

- remove cows with missing values, scored twice without identification /pedigree

7,215

- merge with calving data (DIM < 450)

**1,885 cows with genotypes (scored at least two times)**

# Traits

binary traits:	TBIN*	1= at least one obs. with DD(=M2/M4), else = 0
	TBINA*	1= ... with M2, else = 0
	TCHRONA	1= ... with proliferation of skin, else = 0

type traits:	TCTM2*	counting M2/ M4/ proliferative(MP) events 1= never, 2= one time, 3= repeatedly
	TCTM4	
	TCTMP	

categorical traits:	TSEVCAT*	1= M0, 2= at least once M4, 3= at least once M2
	TCHRCAT	1= 0, 2= ... hyperkeratosis, 3= ... proliferation
	TMCSEV	0=M0, 1=M4-1, 2=M4-2, 3=M2-0, 4=M2-1, 5=M2-2
	TTRANS*	score for classified transitions between M-stages

\*analogous to Schöpke *et al.*, 2015

# GWAS - technique

fixed effects:            farm (1 to 7),  
                              parity (1 to 5),  
                              DIM (50d steps, 0 to 350+)  
                              number of observations per cow (2 or 3)

## software:

### PLINK v.1.07 (Purcell *et al.*, 2007)

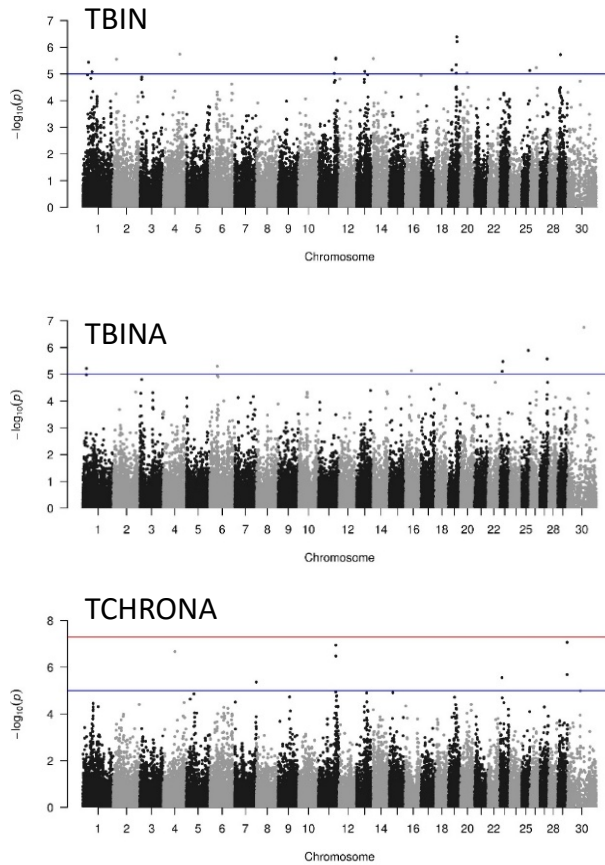

- genome wide + chromosomewise
- --hardy --maf 0.05
- “qqman” for Manhattan plots R version 3.0.2 (R Core Team, 2013)
- no fixed effects for binary traits

### SAS 9.4 (SAS Institute Inc., 1996)

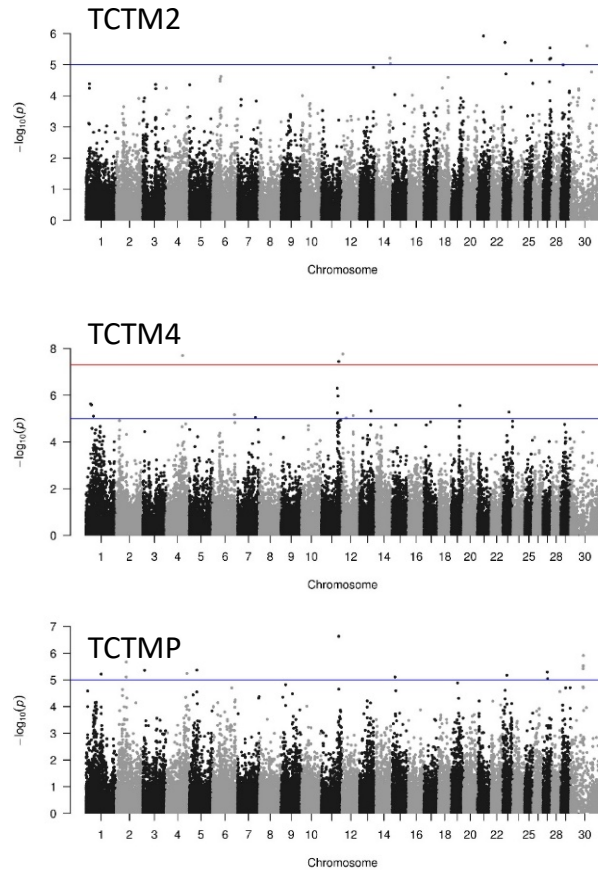

- genome wide
- “Proc glimmix” for binary traits
- “Proc mixed” for type and categorical traits

# Results PLINK - overview

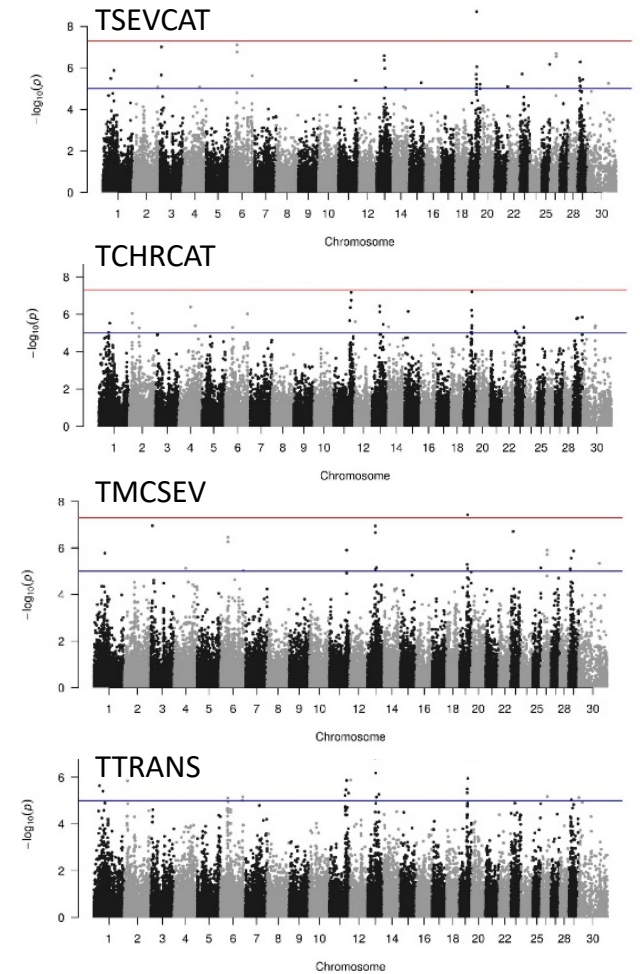

## binary traits

## type traits

## categorical traits

# Results - TCTM4 in detail

PLINK

SAS

- Interesting region on BTA 11 in PLINK and SAS
- BONFERRONI adjusted p-value significant ( $p < 0.05$ ) in PLINK and SAS for 5 different traits (TCHRONA, TCTM4, TCTMP, TCHRCAT, TTRANS)

# Further analysis

GWAS in 6 different variants/data edits:

- A all 1,885 animals
- B without farm 2
- C just 50K typed animals
- D healthy animals from „poor farms“ and affected from „good farms“
- E only 2 categories (best-worst) for type and categorical traits
- F combination of D and E

- interesting region on BTA11 substantiated in 5 of 6 variants with  $BONF < 0.05$
- traits representing chronicity/ course of disease (TCHRONA, TCTM4, TCTMP, TCHRCAT, TTRANS)
- clear trend for the significant traits in genotype frequencies

# Conclusion and outlook

- promising literature research for BTA11:
  - link to alteration of gene expression in immune cells upon spirochetal infection
  - theory: variation in the intensity of expression level alteration affect the individual immune response and thus the course of disease (healing/chronic-proliferation)?
- analysis of 2 to 10 SNPs haplotypes revealed „good“ and „poor“ haplotypes for TCHRONA and helped to identify 12 animals for sequencing
- Research for other interesting regions on BTA 6, 13, 19, 26 and 29 is in progress...

# Thank you for your attention!

Grit.Kopke@landw.uni-halle.de

we gratefully acknowledge:

- BMBF, FBF and DHV for sponsoring Kuh-L project
- project partners: University Kassel, vit, RBB and RinderAllianz

special thanks to Dörte Döpfer, the BDD-team Halle and the participating farms
