Heritability,
what's all
that about?

Genotype

Environment

Phenotype

σ^2 additive genetic variance

σ^2 non-additive genetic variance

σ^2 permanent environmental variance

σ^2 temporary environmental variance

σ^2 phenotypic variance

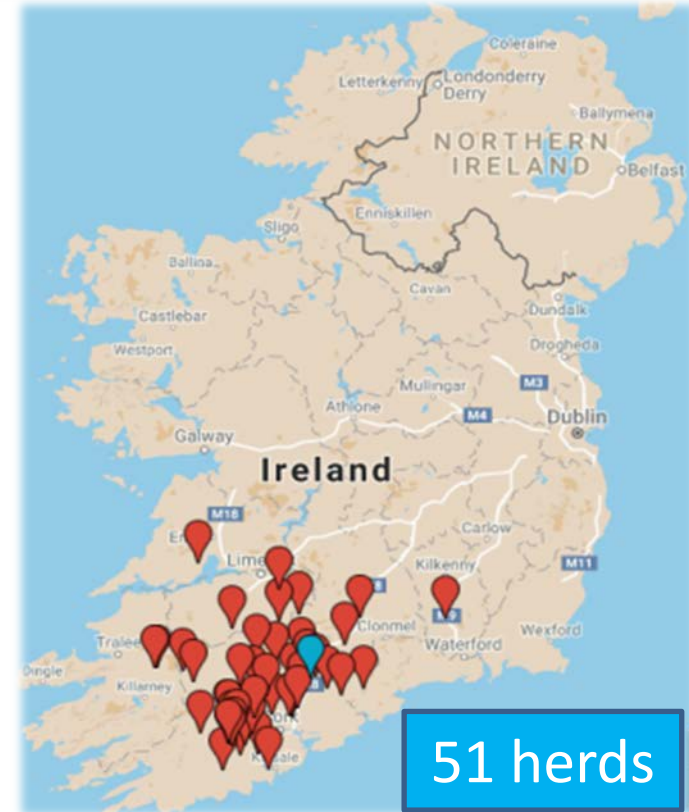

$$\text{Heritability } (h^2) = \frac{\sigma^2 \text{ additive genetic variance}}{\sigma^2 \text{ phenotypic variance}}$$

Objectives

- Quantify the contribution of additive genetics to variation in the presence and severity of hoof disorders
- Quantify their genetic correlation with mobility score

Materials & Methods

Hoof Trimming

Data Edits

- Purchases after 01/01/2015
- Calving event > 365 days prior to hoof trimming
- Unknown sires
- Contemporary groups (HYS) < 5

6,966 animals in 222 HYS remain

Model

- Hoof disorder severity or presence *Dependent Variable*
- Parity (1, 2, 3, 4, 5, >5) *Fixed Effects*
- Age at calving relative to parity median (months)
- Stage of lactation (months)
- Interaction between hoof disorder scorer and trimming date
- Heterosis and recombination loss coefficients
- Herd-Year-Season of calving
- Direct additive genetic *Random Effects*
- Residual

Binary Trait Results

Overgrown

Prevalence = 52%
 $h^2 = 0.08$ (0.02)
 $\sigma_g = 0.13$

Sole Hemorrhage

Prevalence = 53%
 $h^2 = 0.24$ (0.03)
 $\sigma_g = 0.22$

White Line

Prevalence = 49%
 $h^2 = 0.12$ (0.02)
 $\sigma_g = 0.15$

Severity Trait Results

Overgrown

$h^2 = 0.16$ (0.03)
 $\sigma_g = 0.30$

Sole Hemorrhage

$h^2 = 0.26$ (0.03)
 $\sigma_g = 0.66$

White Line

$h^2 = 0.21$ (0.03)
 $\sigma_g = 0.57$

Genetic Correlations

Mobility score

$h^2 = 0.08 (0.03)$

$\sigma_g = 0.16$

Overgrown

0.37 (0.19)

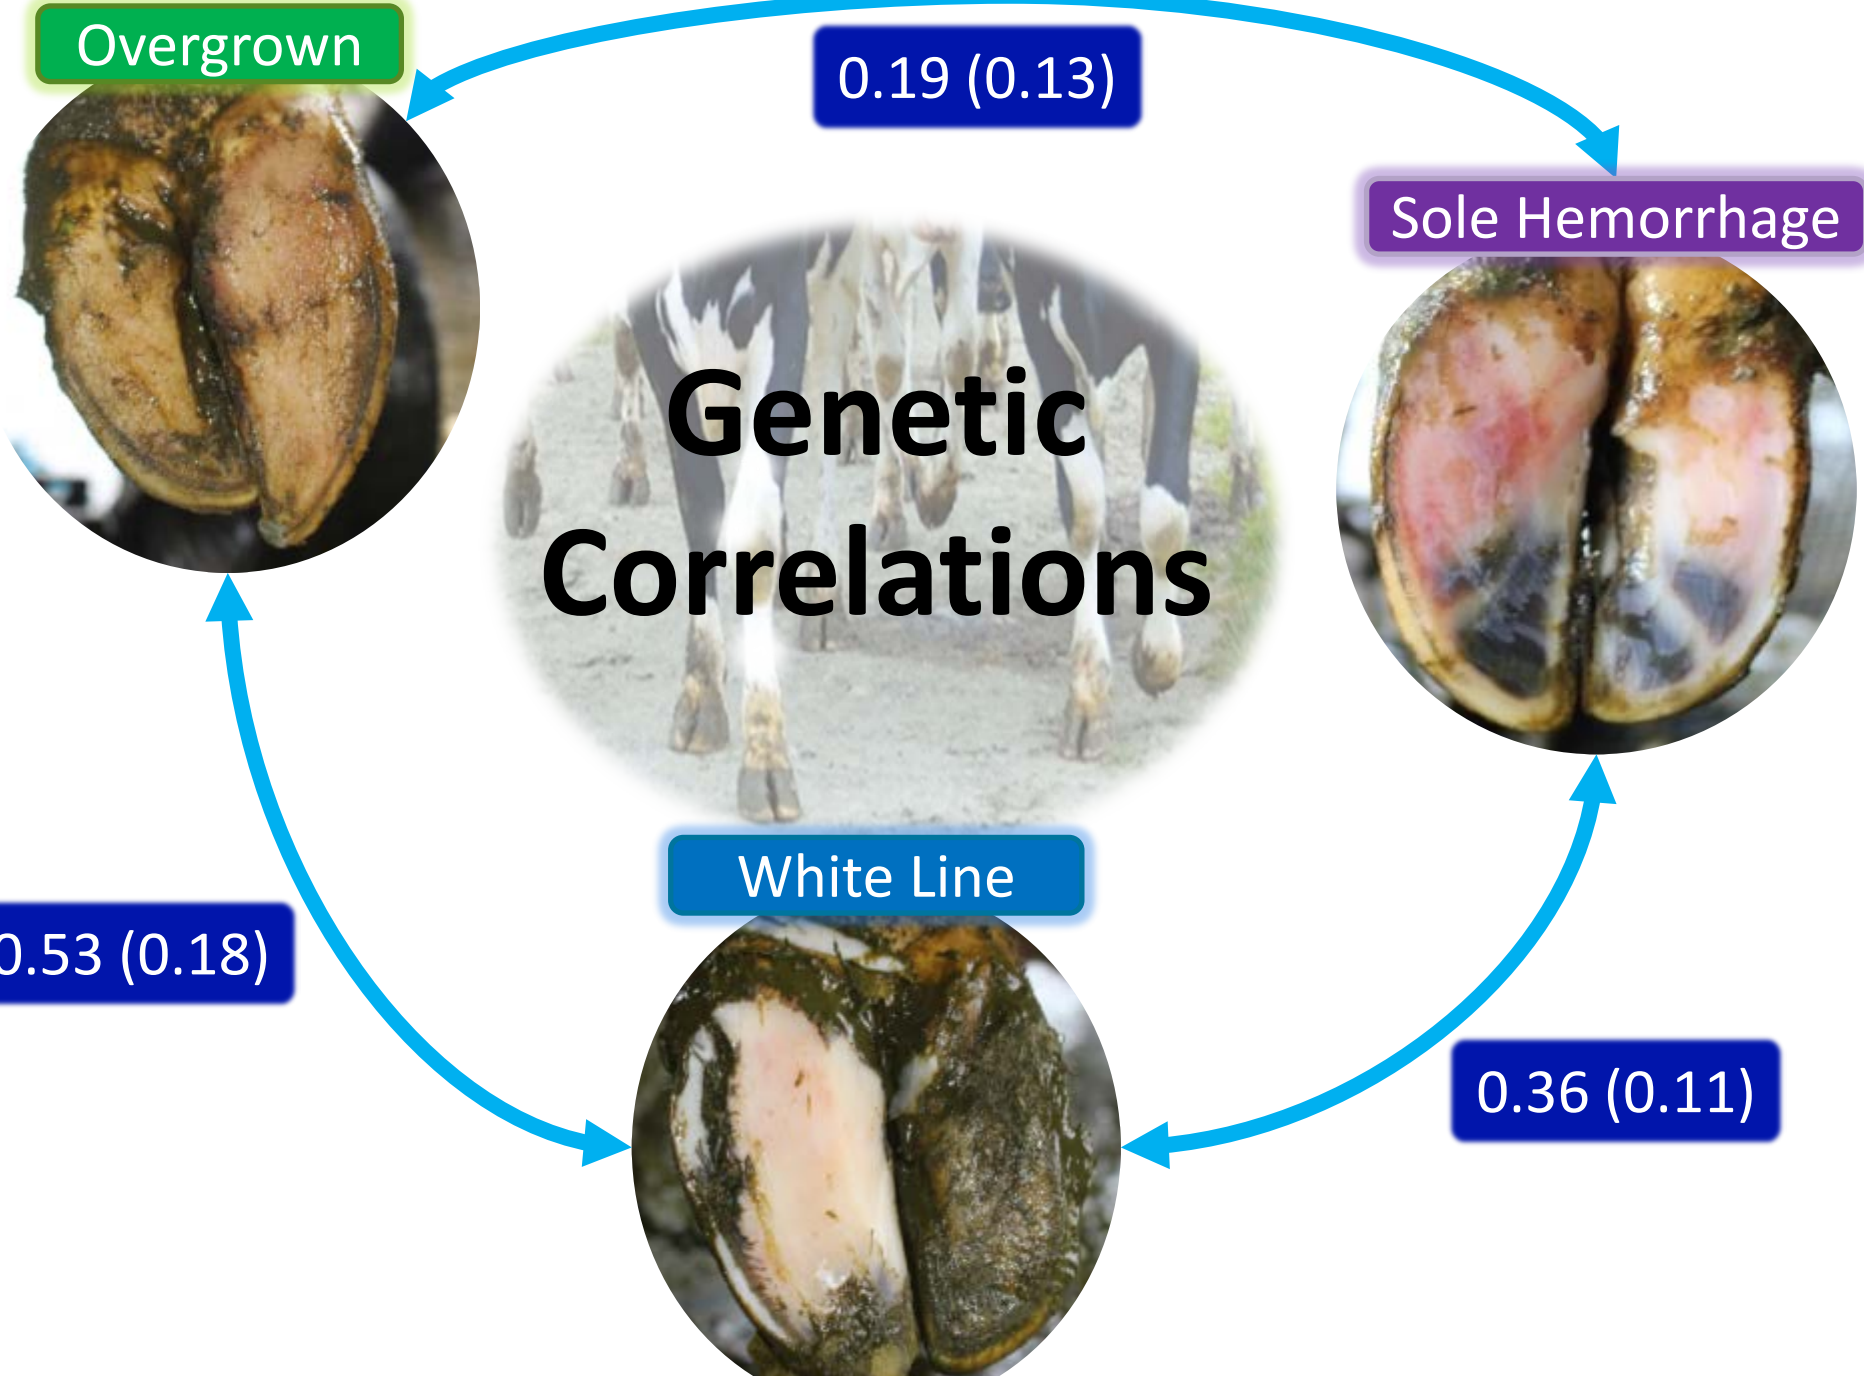

Sole Hemorrhage

0.13 (0.17)

White Line

0.18 (0.18)

Conclusions

- High phenotypic prevalence
- Ample genetic variation exists
- Moderate to highly heritability traits
- Positive genetic correlations between traits
