EAAP 2018
Dubrovnik, Croatia, 27th August 2018

Introduction

- Small cattle populations
- Genomic selection
not fully integrated
- Sustainable strategy to catch up with other populations?

Aims

- 1) Develop the simulator
- 2) Sire selection scenarios
- 3) Sire use strategies

The simulator

- Cattle population under selection
- Overlapping generation
- User-defined parameters
 - % selected, years in use, dosage, selection criterion ...
- Progeny and genomic testing (10K reference)
- Python wrapper around AlphaSim (Faux et al., 2012) and blupf90 (Misztal et al., 2002)

Sire selection scenarios

	Sires of Sires	Sires of Dams
PT		
GS-PS		
GS-C		
GS-BD		
GS		

Progeny testing
- pre-selection on parent average

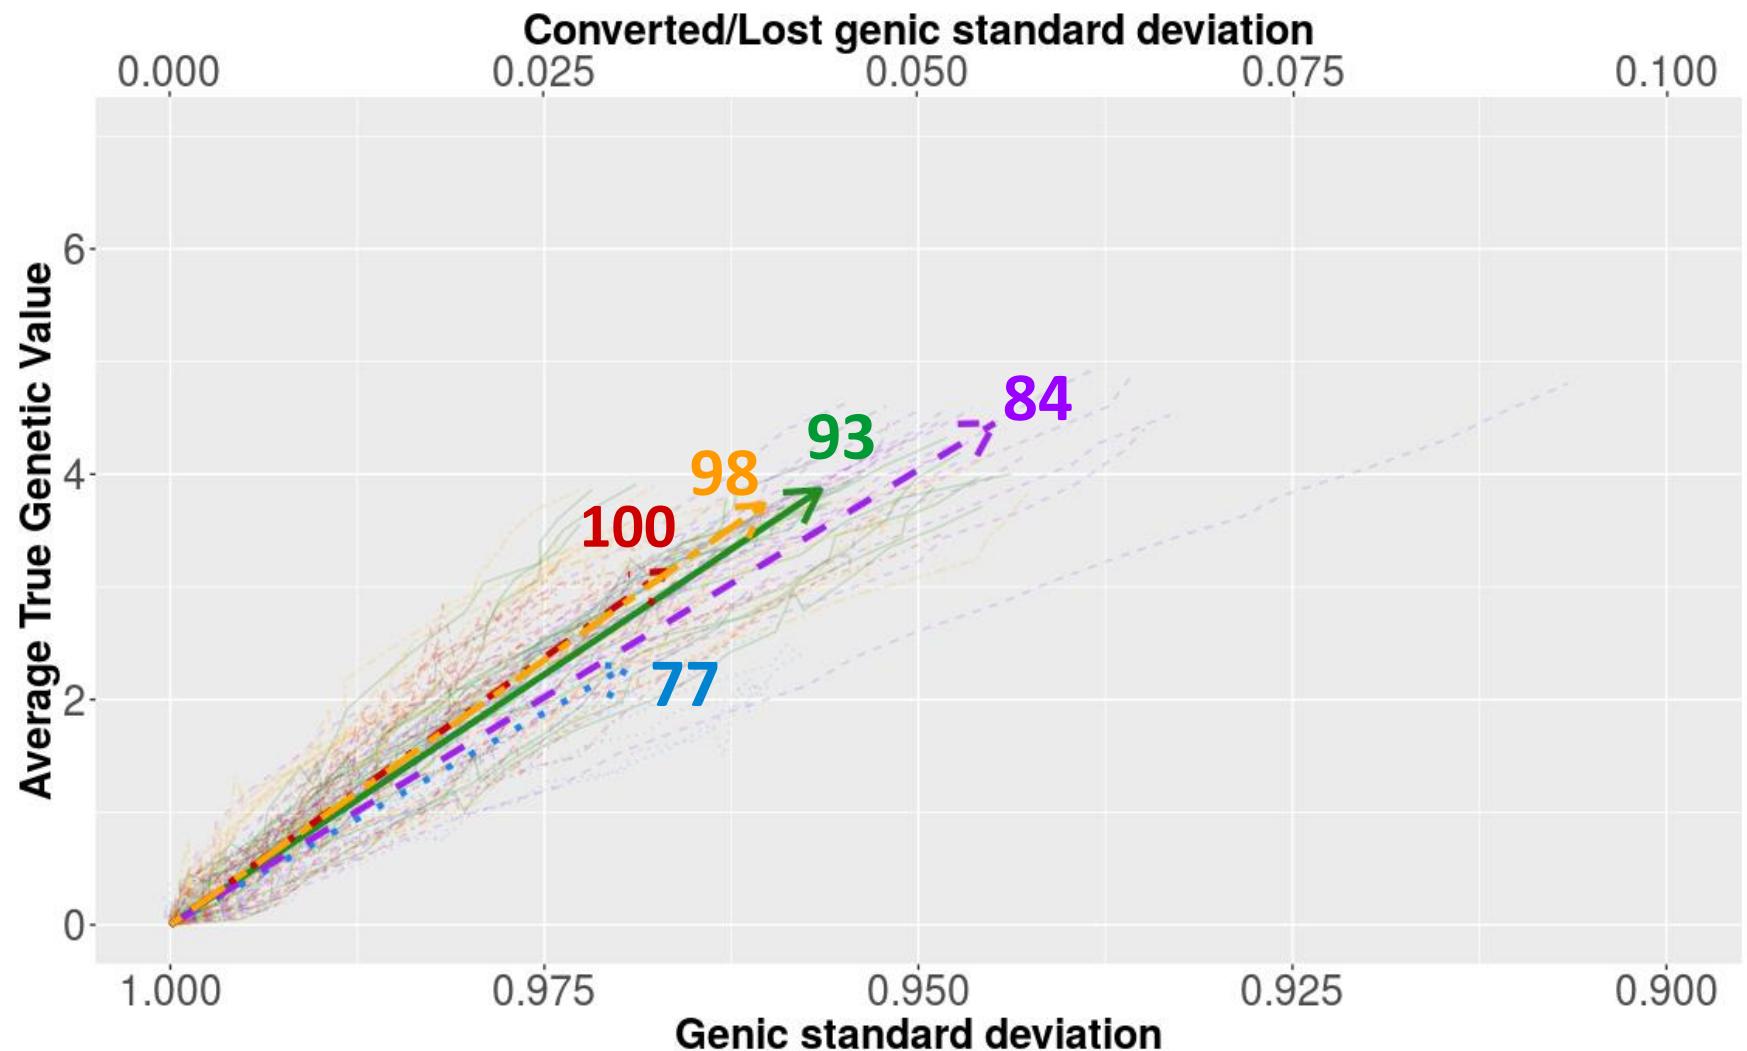

Progeny testing
- pre-selection on gEBV

Genomic testing

Genetic gain

Selection efficiency

Effective population size

	Genomic (via locus heterozygosity)			
	Pedigree	Neutral	Selection	QTN
PT	270	178	175	172
GS-PS	372	165	162	159
GS-C	330	134	132	129
GS-BD	267	122	121	119
GS	213	93	92	90

Sire use strategy

5 bulls / 5 years

PS
GS-PS
GS-C
GS-BD
GS

1 bull / 5 years

PS
GS-PS
GS-C
GS-BD
GS

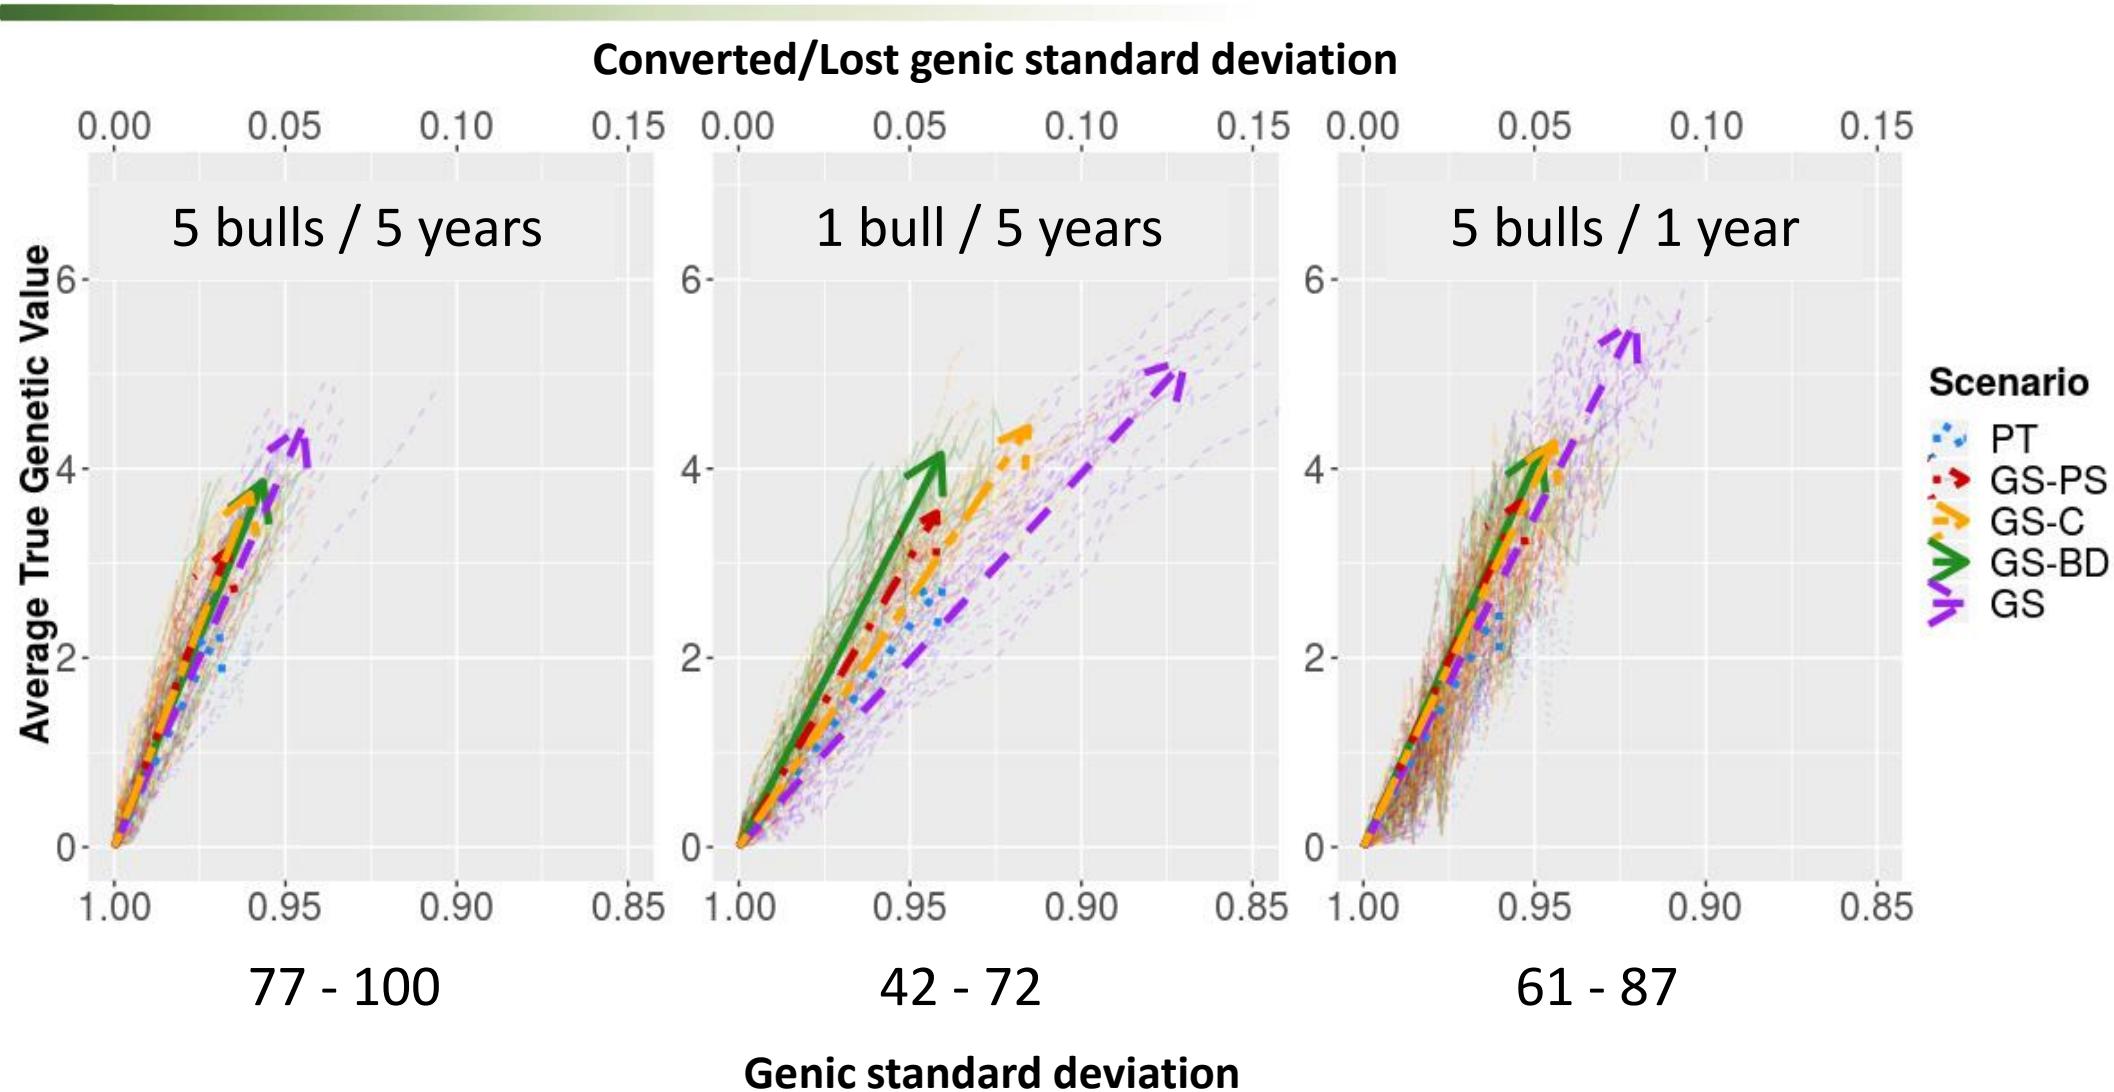

5 bulls / 1 year

PS
GS-PS
GS-C
GS-BD
GS

Genetic gain of the tested scenarios in the last generation.

	5 bulls / 5 years	1 bull / 5 years	5 bulls / 1 year
PT	100%	121%	110%
GS-PS	136%	153%	159%
GS-C	162%	193%	186%
GS-BD	168%	181%	182%
GS	194%	224%	242%

Efficiency of the tested scenarios in the last generation.

Effective population size (genomic) of the tested scenarios in the last generation.

	5 bulls / 5 years	1 bull / 5 years	5 bulls / 1 year
PT	175	98	186
GS-PS	162	101	149
GS-C	131	65	126
GS-BD	120	96	113
GS	91	38	73

Conclusions

- Developed a realistic cattle breeding simulator
- Sire selection scenarios
 - Genetic gain increases with genomics and reduced interval
 - Hybrid scenarios the most efficient
 - Use of genomics and increased intensity reduce N_e
- Sire use strategies
 - Very high intensity obviously not recommended
 - Rapid turn-over of bulls increases gain and only slightly decreases efficiency and N_e
