69<sup>th</sup> EAAP Annual Meeting, Dubrovnik 2018

# Outline

- 1 Introduction
  - Meat quality
  - Meat tenderness is a complex trait
- 2 Material and Methods
  - Data collection
  - Data analysis
- 3 Results
  - pH/temperature decay descriptors
  - Effect of animal/carcass descriptors
  - Modelling meat tenderness
- 4 Conclusions

# Meat tenderness

- **Inconsistency** in the **eating-quality** characteristics of meat
  - Is one problem faced by the meat industry worldwide
- **Meat tenderness** - Most important **sensory quality attribute**
- If the **beef is tender**- We are able to evaluate the Juiciness and Flavour
- Consumers are even **willing to pay more** for beef of higher or **guaranteed tenderness**

# Meat tenderness

- **Inconsistency** in the **eating-quality** characteristics of meat
  - Is one problem faced by the meat industry worldwide

# Meat tenderness

## Depends on various physiological factors

- Proteolytic degradation
- Muscle contraction
- Intra-muscular connective tissue
- Marbling
- etc

# Meat tenderness

## Depends on various physiological factors

- Proteolytic degradation
- Muscle contraction
- Intra-muscular connective tissue
- Marbling
- etc

# Meat tenderness

## Critical periods for meat tenderness

- Immediately pre-slaughter
- During slaughter
- Immediately post-slaughter
  - **Interaction** between the **pH** and **temperature** decline
  - Ideal window

# Meat tenderness

## Critical periods for meat tenderness

- Immediately pre-slaughter
- During slaughter
- Immediately post-slaughter
  - **Interaction** between the **pH** and **temperature** decline
  - Ideal window

# Ideal window

## Abattoir Window - Diagram I

# Objectives

- 1 to model the **decrease** in **temperature** and **pH** during chilling of beef carcasses early post-mortem
- 2 to evaluate the extent of **influence** of **live-animal/carcass characteristics** (i.e., sex, weight, age, breed, class, fat cover, conformation, and transport and lairage time) on the **pH** and **temperature** decline rates
- 3 Classification of beef carcasses into **optimal quality** (OQ) and **cold-shortened** (CS) taking into account the **ideal window rule**
- 4 Assess the combined effects of early post-mortem pH/temperature decline and animal/carcass characteristics on meat tenderness
- 5 The **ultimate aim** is to **build practical models** that can be used to **predict the minimum ageing period** of a beef carcass

# Animals

## Study 1: Modelling pH/temperature decline

- 126 beef animals (74 cross-breed and 52 Mirandesa breed)
  - 85 males and 41 females
  - Average age of  $10.1 \pm 2.32$  months

## Study 2: Modelling meat quality

- 51 Mirandesa breed animals
  - 34 males and 17 females
  - Hot carcass weight:  $209.7 \pm 65.60$  kg

# pH/temperature measurements

## Study 1 and 2

- pH and temperature were recorded
  - Intervals of 10 min during 24 h of carcass chilling
  - *longissimus thoracis* muscle at 4<sup>th</sup> rib level
  - OMEGA wireless receiver/host (UWTC-REC1)

# Meat tenderness

## Study 2: Meat samples

- *longissimus thoracis et lumborum* muscle from the 12th thoracic vertebrae to the 3rd lumbar vertebrae
- Meat blocks were vacuum packed (1, 2 or 3) and randomly assigned to one of three ageing periods (3, 8 and 13 days)
- Tenderness
  - Cooked at 70°C until the sample reached an internal temperature of 70°C
  - 1-cm cork-borer to give the maximum number of sub-samples
  - Ten to fifteen replicates of 1 cm<sup>2</sup> cross-sectional area
  - TA.XTPlus texture analyser - Warner-Bratzler

# Modelling of pH/temperature decline

- **Exponential Decay** function proposed by Hwang and Thompson (2001)

$$Y_{(t)} = A_{(u)} + (A_{(i)} - A_{(u)}) \times e^{-k \times t}$$

- **where:**

- $Y_{(t)}$  is the *pH* or *temperature* at time  $t$
- $A_{(u)}$  is the final *pH* or *temperature*
- $A_{(i)}$  is the initial *pH* or *temperature*
- $k$  is the exponential constant of decay
- $t$  is the time in hours after slaughtering

# pH/temperature descriptors

- **pH**: 1.5, 3.0, 4.5, 6.0 and 24 hours
- **Temperature**: 1.5, 3.0, 4.5 and 6.0 hours
- **timepH6.0**: time at  $pH = 6.0$
- **TemppH6.0**: Temperature at pH6.0
- $k_{pH}$ : exponential decay parameter for pH decline
- $k_{Temp}$ : exponential decay parameter for temperature decline

# Animal/carcass characteristics considered as regressors

- sex, age, breed
- hot carcass weight (**HCW**)
- transport time (**tTransport**), lairage time (**tLairage**)
- animal class: **Calf**, **Vealer** or **Yearling**

# Modelling shear force during ageing

## Linear mixed-effects model

$$SF_{ij} = \beta_{0j} + \beta_{1j} \times Ageing_{ij} + \beta_2 \times Ageing_i^2 + \beta_3 \times pH_{ep} + \beta_4 \times k_{pH} \times Ageing_i + \beta_5 \times Sex + \varepsilon_{ij}$$

$$\beta_{0j} = \beta'_0 + u_j$$

$$\beta_{1j} = \beta'_1 + v_j$$

**Random-effects** terms  $u_j$  and  $v_j$  were added to the mean of the intercept  $\beta_0$  and time slope  $\beta_1$  to account for random shifts due to carcass  $j$ .

# pH/temperature decay modelling

# Mean, median and range of pH/temperature decline descriptors

Estimated values and model parameters	Mean	Median	Min	Max
pH <sub>1.5</sub>	6.52	6.53	6.01	6.93

# Compliance discrimination

## Sex effect on meat tenderness

## Class effect on meat tenderness

# Compliance

# Conclusions I

- 1 Considerable variation in:
  - 1 rigor time: 1.5 – 20.2 hours
  - 2 rigor temperature: 2.0 – 35.0°C
- 2 Quality of meat tenderness could be either optimal (~61%) or cold-shortened (~39%)
- 3 A two-dimensional principal component analysis showed that five variables –  $HCW$ ,  $k_{pH}$ ,  $k_T$ ,  $pH_{3.0}$  and  $T_{3.0}$  hours post-slaughter - can be used to distinguish the beef meat quality into cold-shortened and optimal quality
- 4 The rate of tenderisation is higher in the early post-mortem carcasses and slows down as ageing time elapses for the carcasses

## Conclusions II

- 5 Carcasses of **low final pH** produced the **least tender meat** throughout the ageing period but with **a sharp decline in shear force attained tenderness levels at 13 days post-mortem** comparable to those of high pH meat
- 6 This study clearly shows that a **quality control system** can be implemented based on the **pH/temperature descriptors**

THE END! I

THANK YOU FOR YOUR ATTENTION

OBRIGADO PELA ATENÇÃO
