Introduction

- Runs of homozygosity (ROH) are segments of continuous homozygous genome
- ROH can be useful for characterizing livestock genomes and understanding implications of strong selection
- Livestock genomes are mostly homozygous
 - Alternative: heterozygous clusters, runs of heterozygosity (ROHet)

Objective

- Analyze the turkey genome for runs of homozygosity and runs of heterozygosity
- Compare inbreeding levels using ROH (F_{ROH}) and pedigree information (F_{PED})

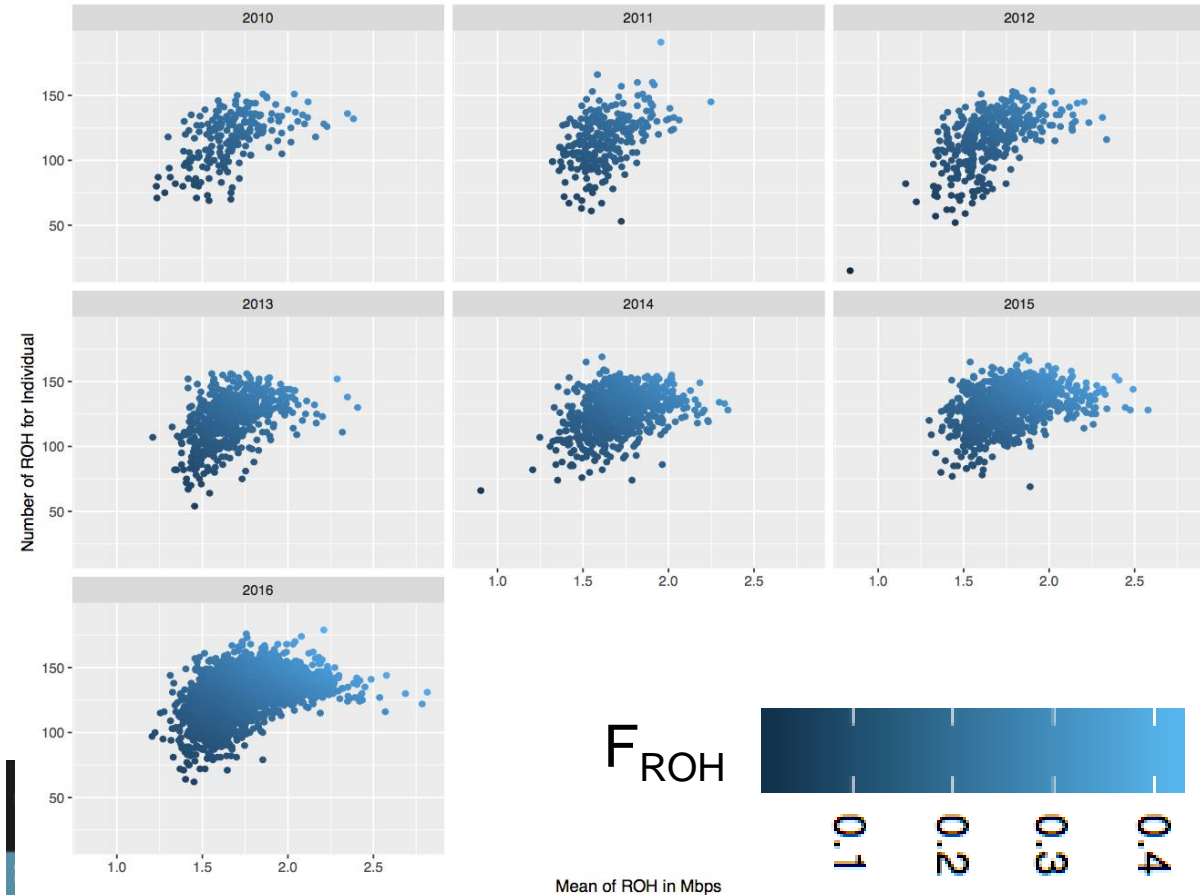

Data

- A commercial line with 5,297 individuals
- Pedigree records for 773,414 individuals
 - Maximum depth of 29 generations
- Markers call-rate threshold: 90%
- After editing: 56,450 SNP

Run parameters

- ROH and ROHet were detected using the R package “*detectRUNS*” v.0.9.5
- Parameters:
 - Minimum length
 - 50 SNP for ROH
 - 20 SNP for ROHet
 - 1Mb for ROH and ROHet
 - No missing or opposite genotypes
 - Maximum gap between consecutive SNP: 106 bp

ROH / Individual

Number vs mean length of ROH (in Mb). Gradient expresses calculated inbreeding (F_{ROH}) for each section of the plot

ROH distribution

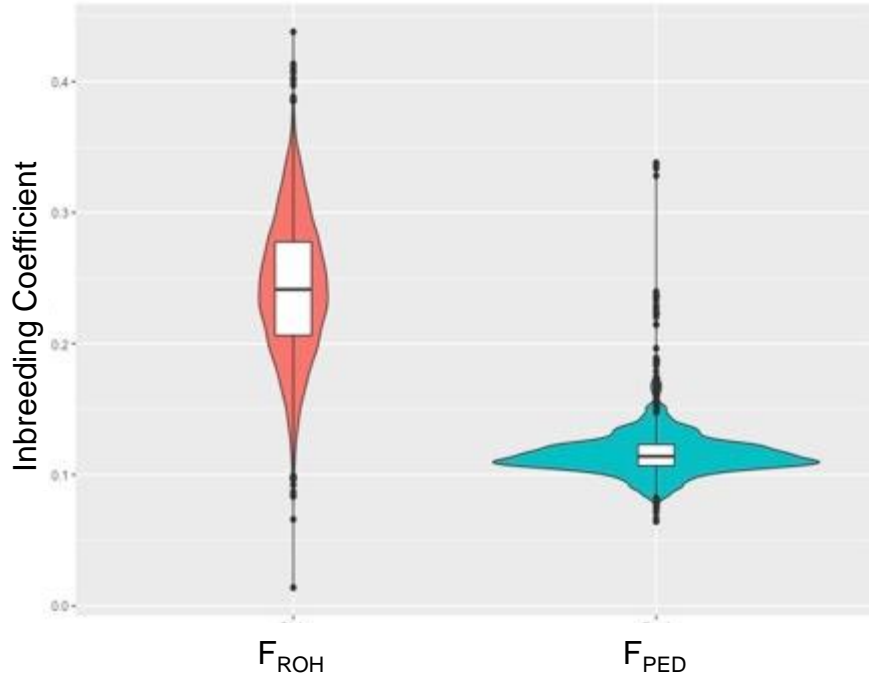

Average number of ROH per bird

Average number of ROHet per bird

Class (Mb)	ROH	
	Average n ROH / bird	Mean length of ROH / bird
1-2	37.52 (\pm 7.1)	1.49 (\pm 0.1)
2-4	27.39 (\pm 6.4)	2.75 (\pm 0.1)
4-8	8.30 (\pm 3.6)	5.28 (\pm 0.4)
8-16	1.88 (\pm 1.2)	10.08 (\pm 1.5)
>16	1.10 (\pm 0.3)	19.06 (\pm 3.7)
Total	126.21 (\pm 17.7)	1.73 (\pm 0.2)

(standard error in brackets)

Inbreeding levels

Distribution of F_{ROH} and F_{PED}

Average F_{ROH} per chromosome (corrected for length)

% of SNP inside ROH across genome

Next Steps: Focus on Phenotypes

Reproduction Traits

- Broodiness & Pause length
- Number of clutches
- Egg production
- Hatchability

REPRODUCTION

HEALTH & WELFARE

Efficiency Traits

- Feed Efficiency
 - Growth rate
 - Feeding traits
- Breeding Efficiency

EFFICIENCY

PRODUCTION

Health and Welfare Traits

- Pecking behaviour / Aggression
- Mortality and livability
- Health
- Environmental Resilience

Production Traits

- Meat Quality
 - pH, drip loss, colour, etc.
 - Technological and sensory properties
- Meat Quantity
 - Carcass composition
 - Whole-body yield

Conclusions

- Initial report of ROH and ROHet in turkey
- Long and abundant ROH detected
 - Heterozygosity islands
 - Some clusters on specific chromosomes
- ROH inbreeding higher than pedigree inbreeding
- Work underway to determine which phenotypes are affected by homo / heterozygosity

Hybrid Turkeys receives funding for \$6 million genomic selection project

Academia, government, industry partners and funding recipients attended a press conference at the University of Guelph on Friday as Kate Young, Canadian Parliamentary Secretary for Science, announced the recipients of Round 7 of **Genome Canada's Genomic Application Partnership Program (GAPP)**. A total of \$17 million was awarded to 5 different projects with Hybrid Turkeys receiving the largest grant for its turkey genomic selection project.
