Verifying the existence of second litter syndrome in pigs

Marcin Pszczola, Egbert F. Knol, Han A. Mulder, Ewa Sell-Kubiak

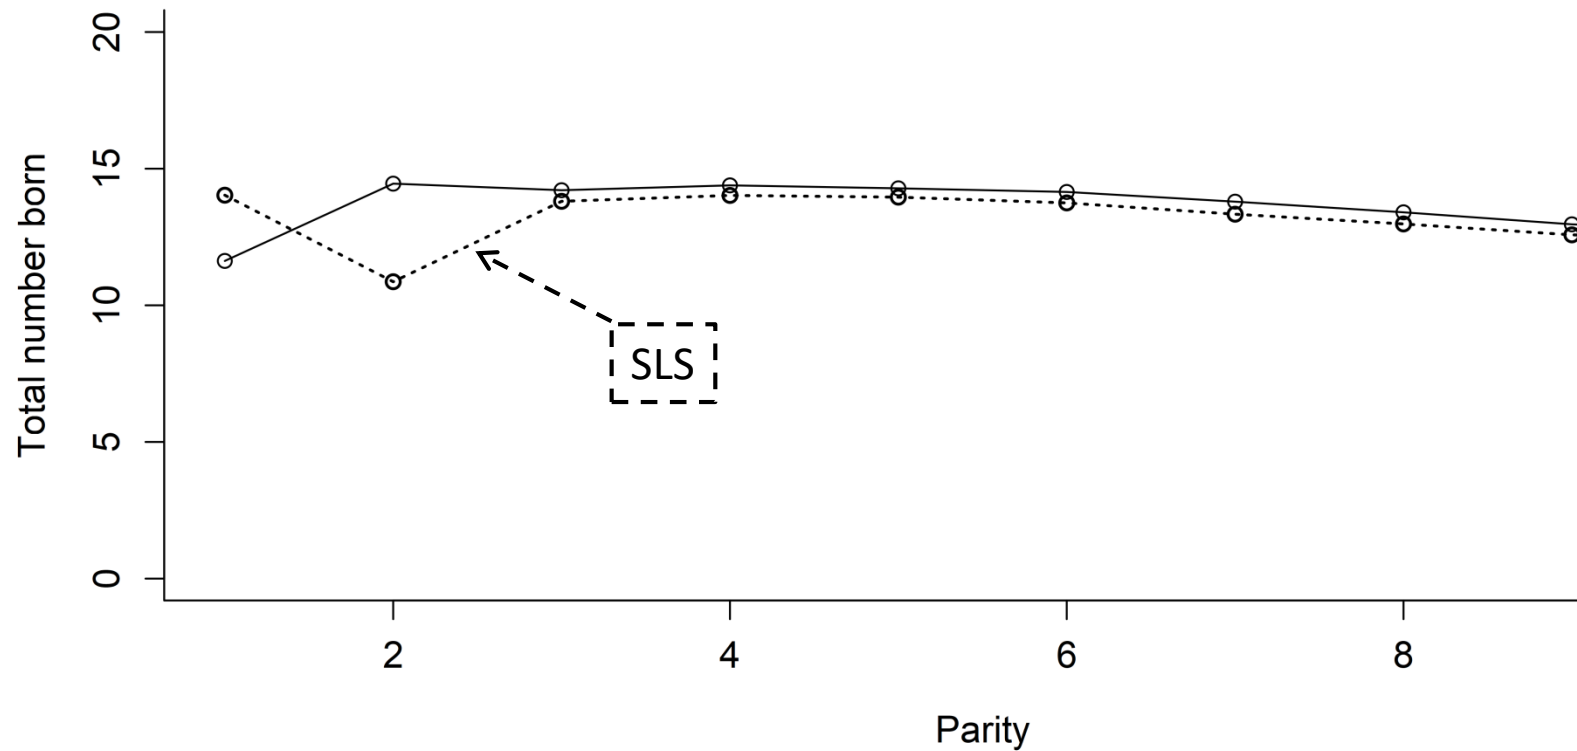

@marcinTHEbee

Total number of born piglets (TNB) in subsequent parities

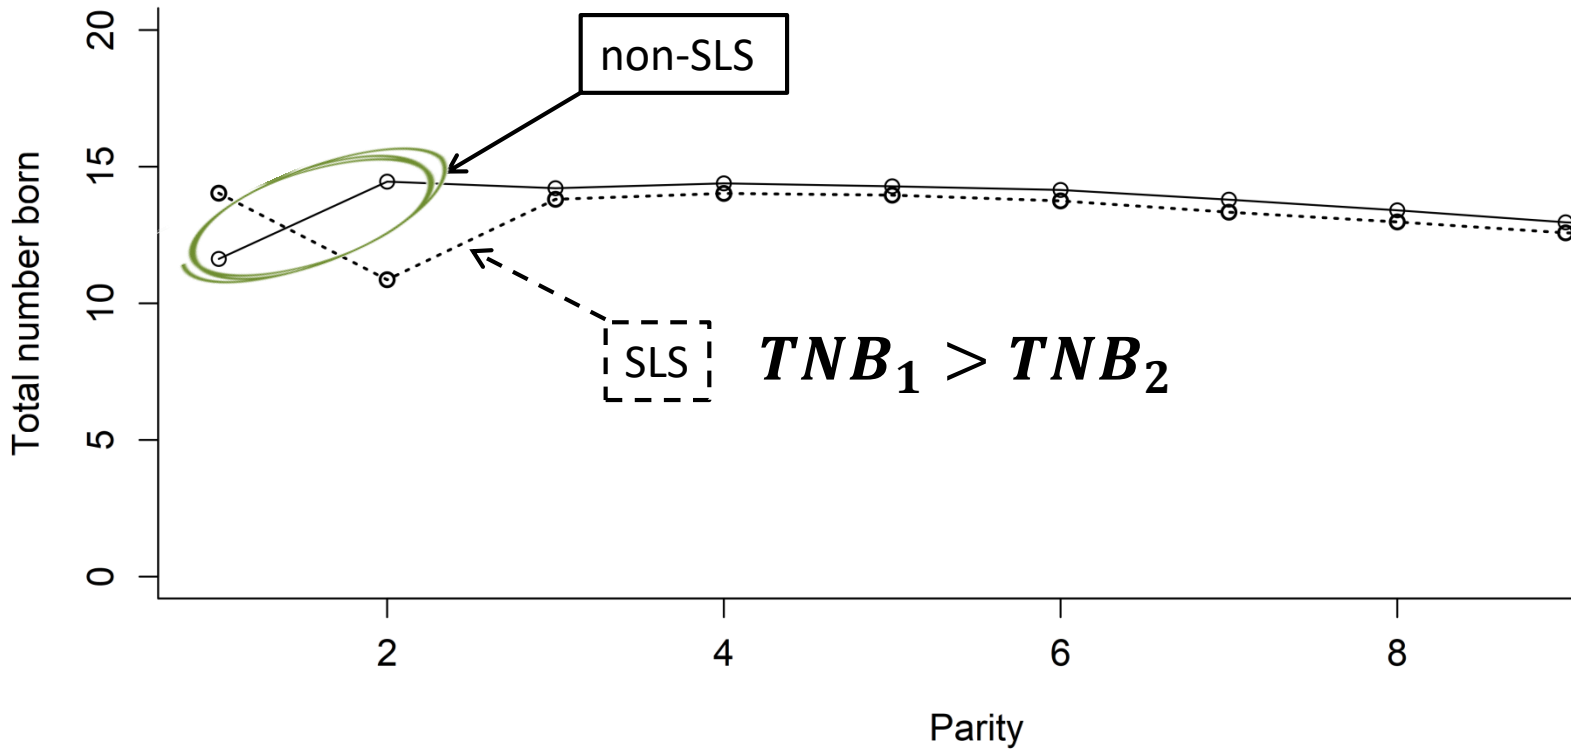

TNB in subsequent parities

TNB in subsequent parities

TNB in subsequent parities

TNB in subsequent parities

DATA

Second litter syndrome (**SLS**)

does not exist!

SIMULATION

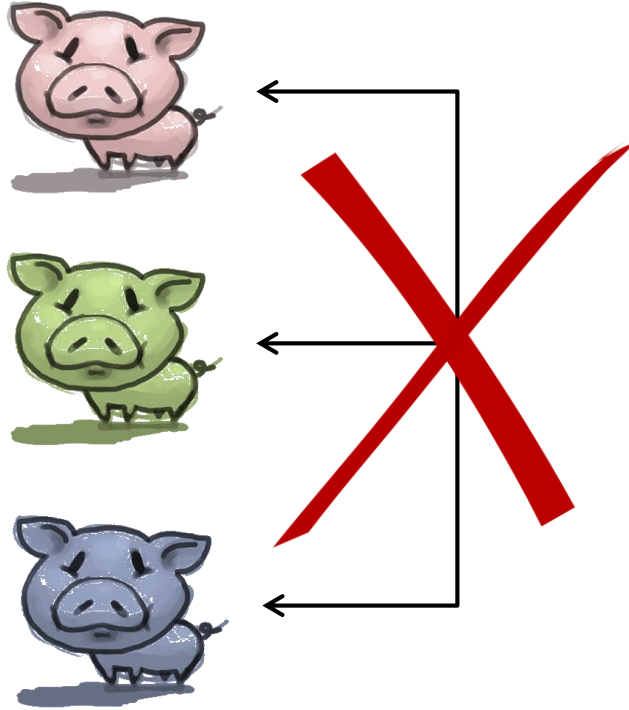

50k sows

9 correlated parities

normal distribution of TNB

100 replicates

SIMULATION SETUP

SIMULATION SETUP

SIMULATION SETUP

Mean and SD of TNB across parities

Parity	Mean	SD
1	12.40	3.03
2	13.33	3.37
3	14.09	3.42
4	14.29	3.66
5	14.19	3.55
6	14.04	3.56
7	13.68	3.52
8	13.30	3.45
9	12.87	3.31

Correlations between parities

Parity	2	3	4	5	6	7	8	9
1	0.20							
2	0.19	0.21						
3	0.19	0.21	0.24					
4	0.18	0.21	0.25	0.26				
5	0.17	0.2	0.25	0.27	0.28			
6	0.16	0.2	0.24	0.27	0.28	0.30		
7	0.16	0.19	0.24	0.26	0.28	0.30	0.31	
8	0.15	0.19	0.23	0.26	0.28	0.30	0.31	0.33

Mean = 0.24,

Min= 0.15,

Max = 0.34

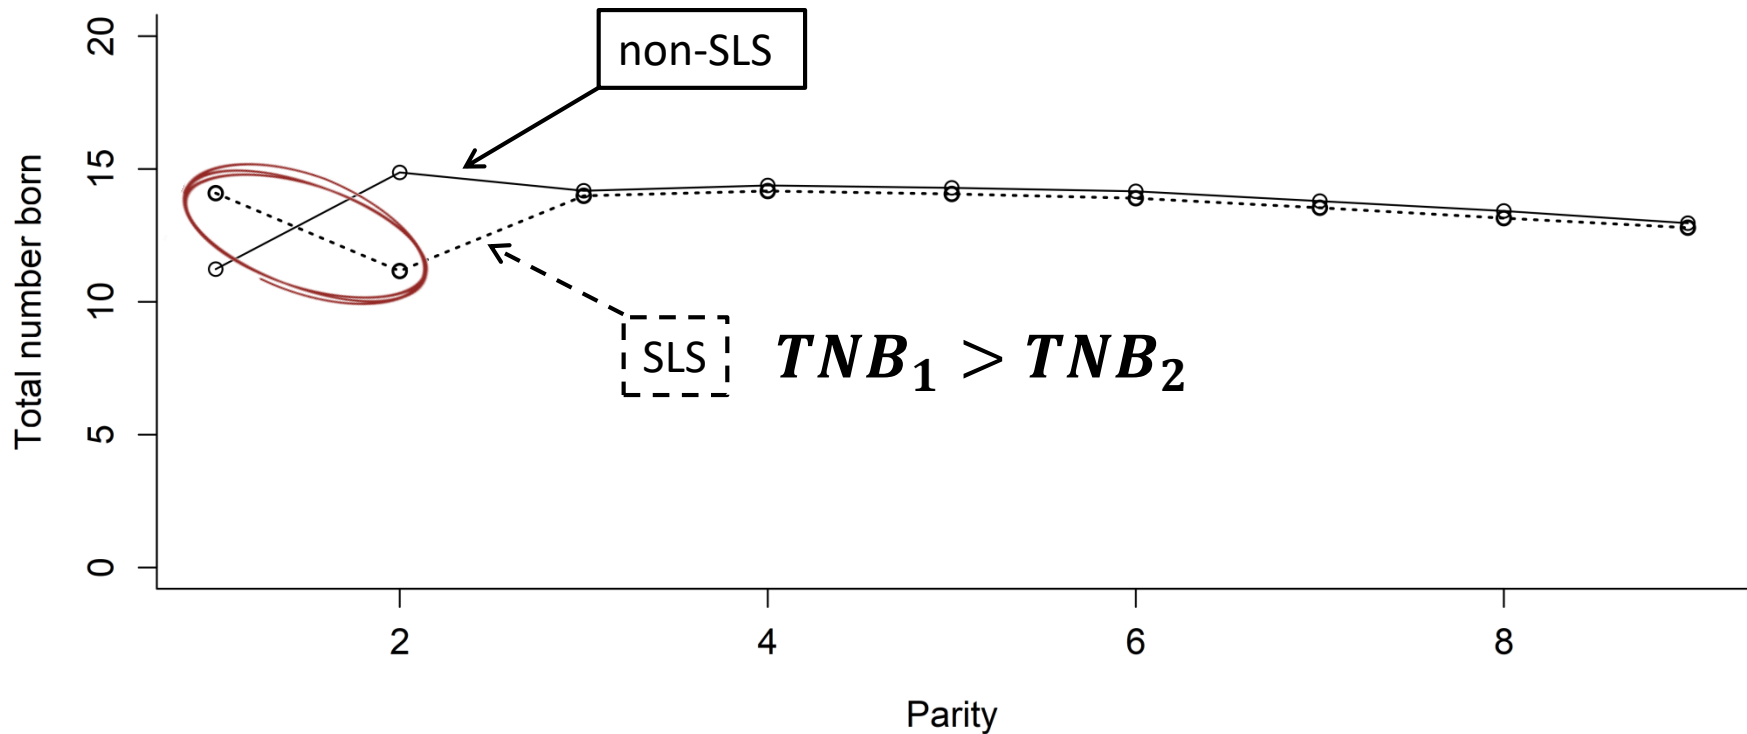

[Simulated] TNB in subsequent parities

Let's look at the statistical properties of the TNB

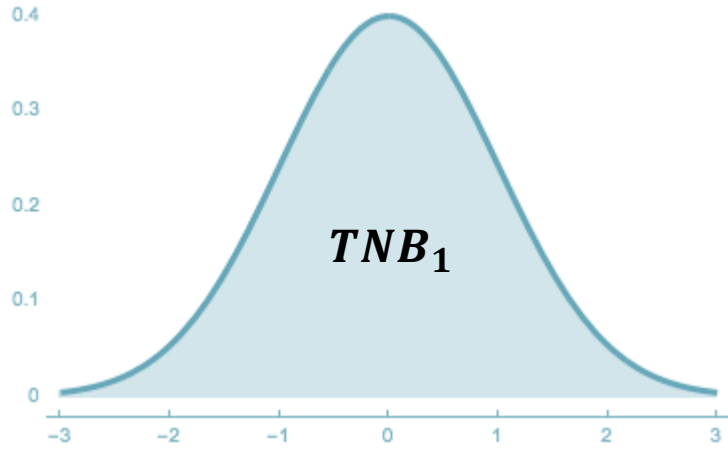

Distribution of TNB

Distribution of TNB

$$\text{Mean}_{\text{TNB}_1} = \text{Mean}_{\text{TNB}_2}$$

$$\text{Mean}_{\text{TNB}_1} = \text{Mean}_{\text{TNB}_2}$$

SLS frequency=50%

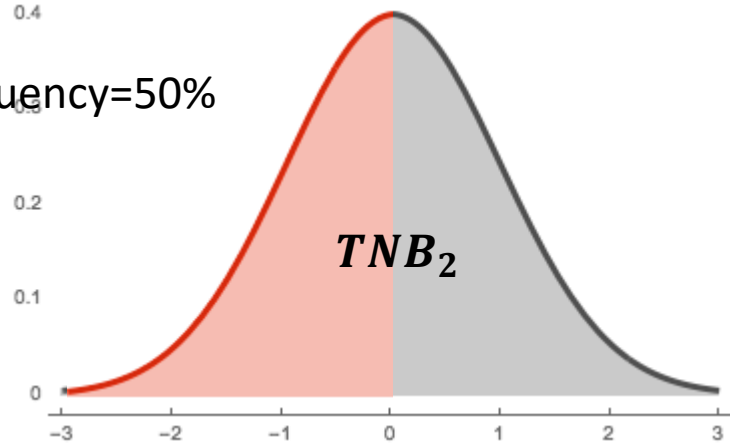

$$\text{TNB}_1 > \text{TNB}_2$$

$$\text{Mean}_{\text{TNB}_1} = \text{Mean}_{\text{TNB}_2}$$

SLS frequency=50%

$$\text{TNB}_1 > \text{TNB}_2$$

$$\text{Mean}_{\text{TNB}_1} > \text{Mean}_{\text{TNB}_2}$$

SLS frequency > 50%

A thick black bracket connects the x-axis of the TNB_1 graph to the x-axis of the TNB_2 graph, indicating that the mean of TNB_1 (0) is greater than the mean of TNB_2 (-1).

$$\text{TNB}_1 > \text{TNB}_2$$

$$\text{Mean}_{\text{TNB}_1} < \text{Mean}_{\text{TNB}_2}$$

$$\text{TNB}_1 > \text{TNB}_2$$

[real data] observed SLS frequency

Data from 67 herds

Min	0.16
Max	0.60
Mean	0.33
SD	0.07

[real data] expected vs. observed SLS frequency

Data from 67 herds

[real data] expected vs. observed SLS frequency

Data from 67 herds

Second litter syndrome (**SLS**)

is the trait property!

How to minimize the frequency of

$$TNB_1 > TNB_2$$

Solution 1:

Maximize mean differences

+

Minimize variability (more uniform litters)

Solution 2:

Accept high frequency of $TNB_1 > TNB_2$

+

Maximize mean litter size

+

Minimize variability (more uniform litters)

SLS is due to the property of the data!

**The frequency of SLS can be reduced by
breeding for uniformity of the litter size.**
