Metabolic disorders

Type 2 diabetes, osteoporosis, obesity + many other diseases...

Epigenetic marks: the basis of memory

① DNA methylation

**CpG islands
often associated with promoter
regions**

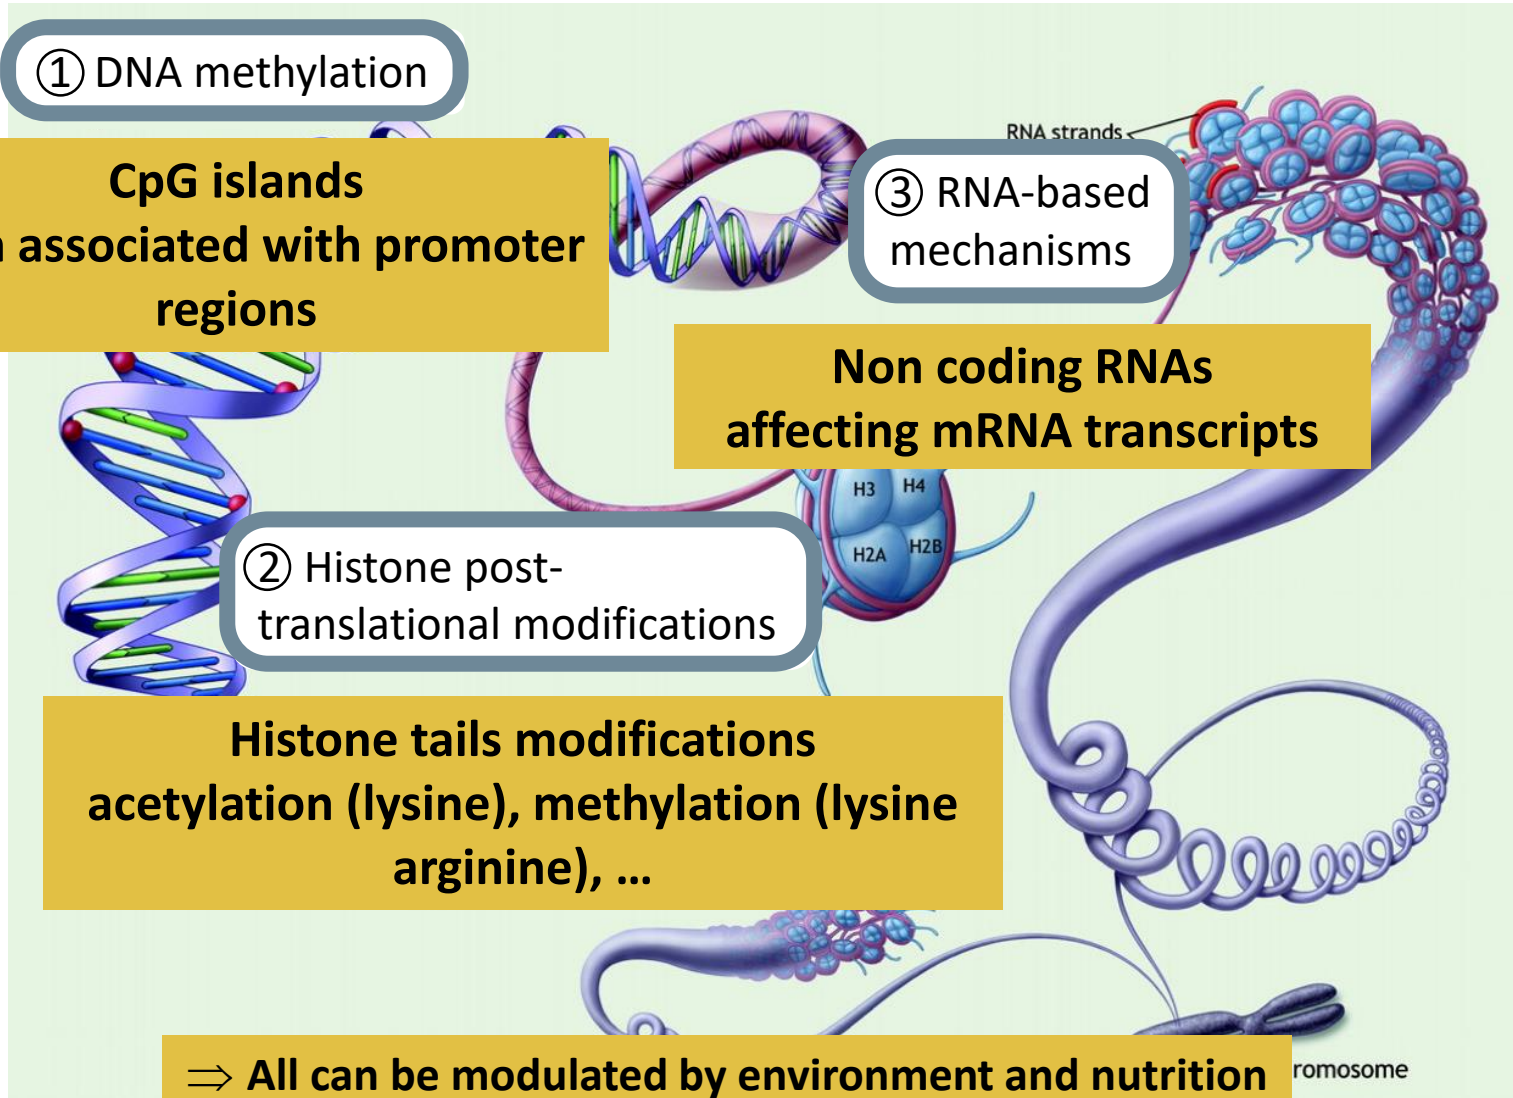

③ RNA-based mechanisms

**Non coding RNAs
affecting mRNA transcripts**

② Histone post- translational modifications

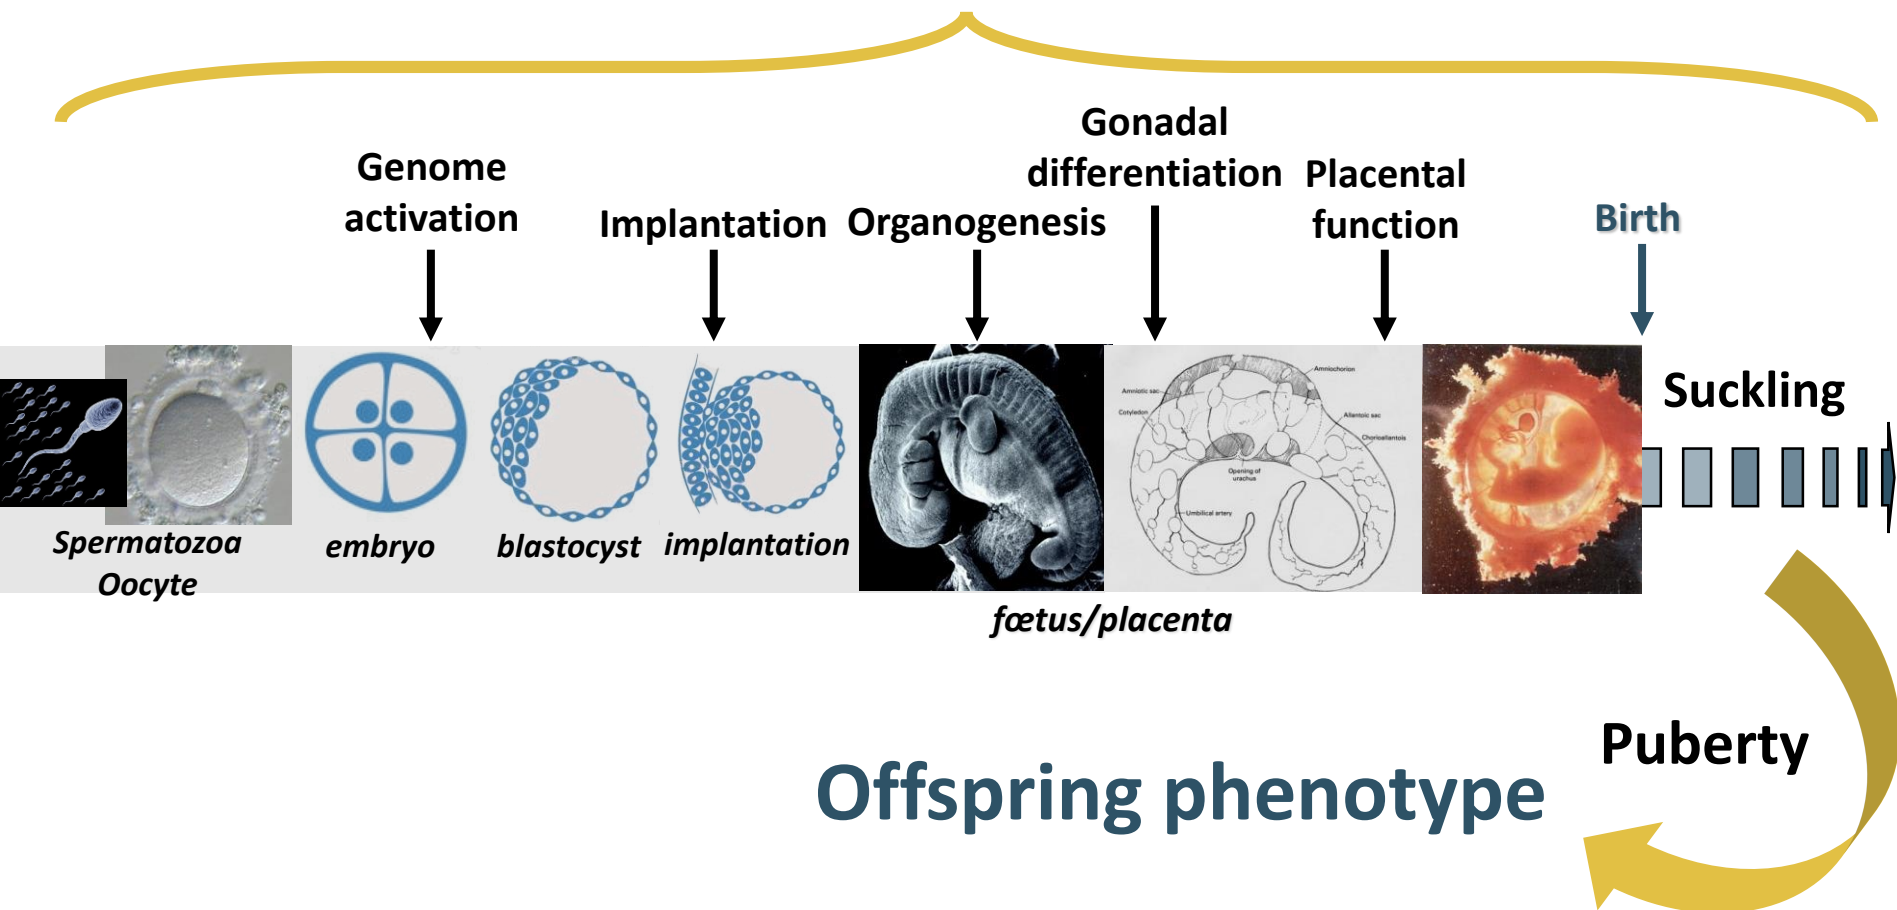

**Histone tails modifications
acetylation (lysine), methylation (lysine
arginine), ...**

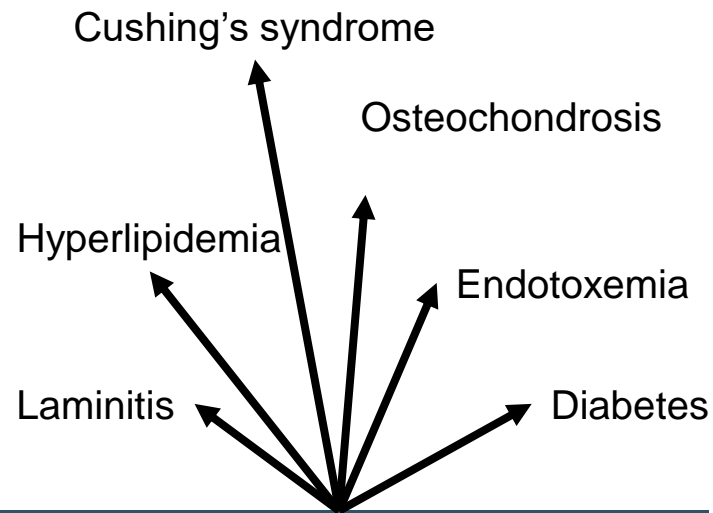

⇒ **All can be modulated by environment and nutrition**
See recent review Chavatte-Palmer et al. Animal, 2018

Critical periods of development

Nutrition and environment

Insulin resistance in horses

EMS - Durham et al. JVIM 2019

There may be truth in focusing on stallions and mares

DEVELOPMENTAL ORIGINS OF HEALTH AND DISEASE (DOHAD)

Not only will the broodmare supply half the genes, but she will carry the foal for nearly 11 months and nurture it for at least its first 6 months.

**1. SETTING THE SCENE : DOHAD, EPIGENETICS AND
CRITICAL PERIODS**

2. PROOF OF CONCEPT IN EQUIDAE

3. IMPORTANCE FOR HORSE BREEDING

4. CONCLUDING REMARKS

“In equidae, fetal growth can be enhanced above or restricted below the normal genetic potential for the breed by varying maternal size.”

(Walton & Hammond, 1938; Allen et al, 2002a; Forhead et al, 2004)

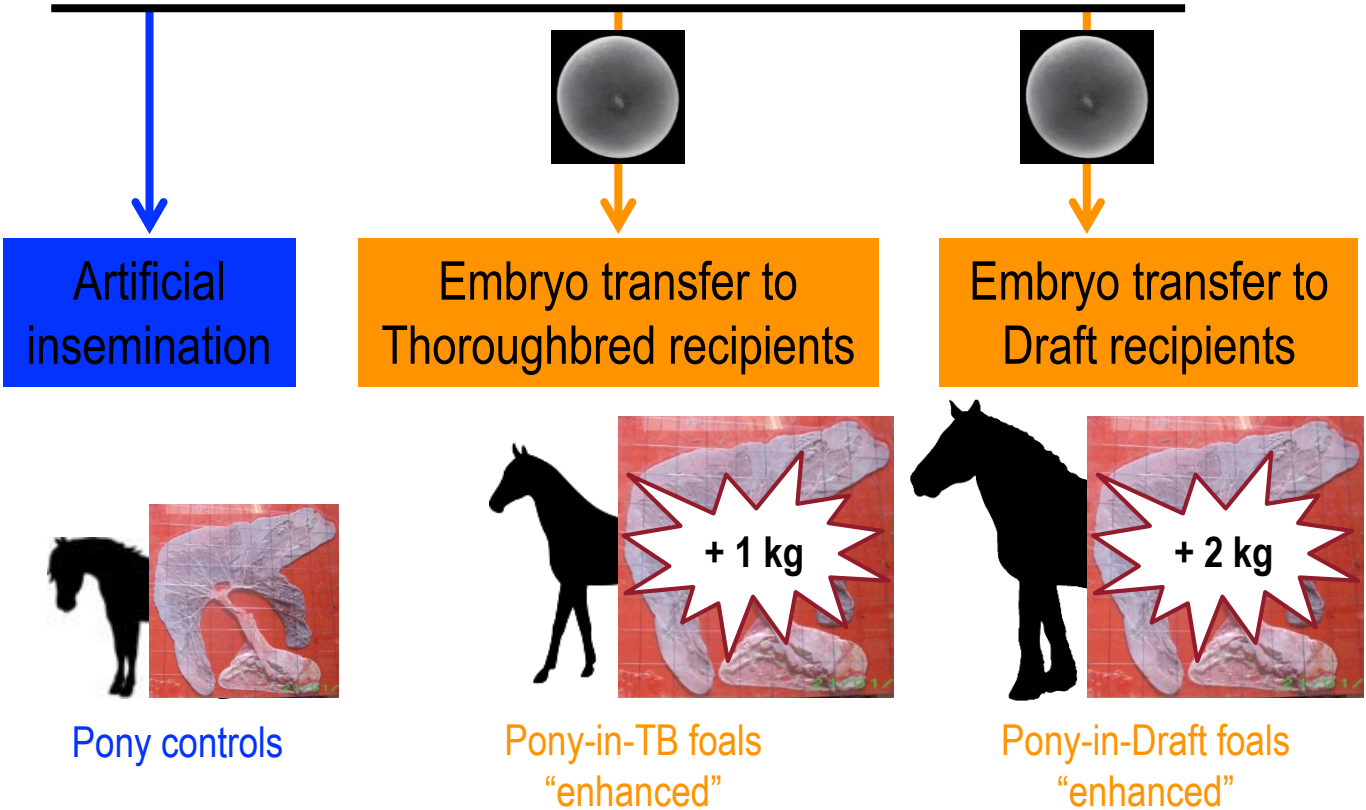

Models of increased fetal growth

Lessons from between-breed embryo transfers

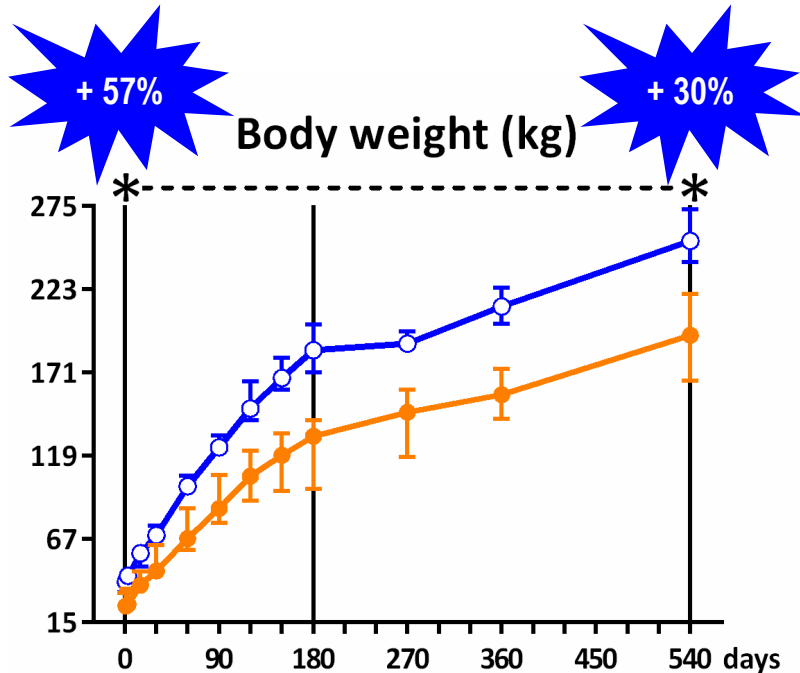

♀ poney x ♂ poney

Allen et al, Reproduction, 2002
Peugnet et al, PLoS ONE, 2014
Robles et al. Equine vet J, 2018

Models of increased fetal growth

■ Control ponies (P-in-P, n=21)
 ■ "Enhanced" ponies (P-in-D, n=6)

Growth of "enhanced" foals (Pony-in-Draft) is amplified in an harmonious way until age 1 year ½.

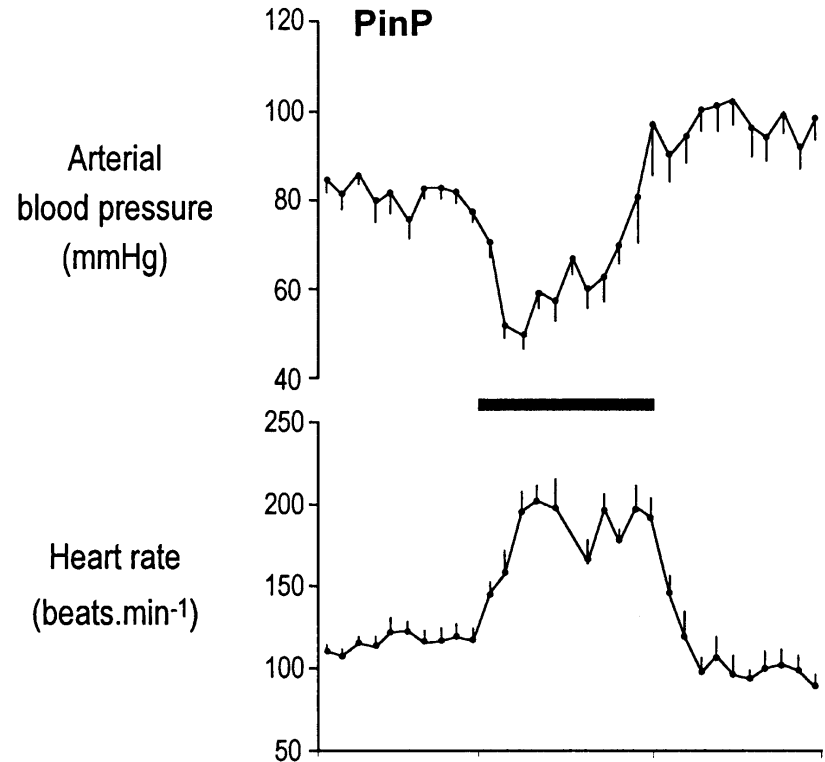

Peugnet et al, J Eq Vet Sci, 2016 - see also Allen et al, Reproduction, 2002; Allen et al, Reproduction, 2004

Models of increased fetal growth

Poney in Thoroughbred, 6 days of age

Induction of hypotension using sodium nitroprusside:

- Similar fall in arterial blood pressure in the 4 groups.
- Similar increase in heart rate in the 4 groups.
- Higher secretion of catecholamines in PinT vs PinP.

“Enhanced” foals (Pony-in-Thoroughbred) have elevated arterial blood pressure, lower baroreflex sensitivity and lower sympathetic stimulation at 6 days of age.

Giussani et al, J Physiol, 2003

Models of increased fetal growth

■ Control ponies (P-in-P, n=21)
 ■ "Enhanced" ponies (P-in-D, n=6)

Newborn - age 3 days

IV glucose tolerance test

Birth
Day 0

Weaning
Day 180

Weanling - age 200 days

Hyperinsulinemic euglycemic clamp

1 year
Day 360

Yearling - age 540 days

Hyperinsulinemic euglycemic clamp

End of monitoring
Day 540

"Enhanced" foals (Pony-in-Draft) show an early resistance to insulin, but no further effect is observed until 1 year ½.

Peugnet et al, PLoS ONE, 2014; Peugnet et al, J Eq Vet Sci, 2016; see also Forhead et al, J Endocrinol, 2004

Models of restricted fetal growth

Lessons from between-breed embryo transfers

Allen et al, Reproduction, 2002, Peugeot et al, PLoS ONE, 2014, Robles et al. Equine vet J, 2018

♀ Thoroughbred x ♂ Thoroughbred

♀ Saddlebred x ♂ Saddlebred

Artificial insemination

Embryo transfer to Pony recipients

Artificial insemination

Embryo transfer to Pony recipients

TB controls

TB-in-Pony foals – restricted

SB controls

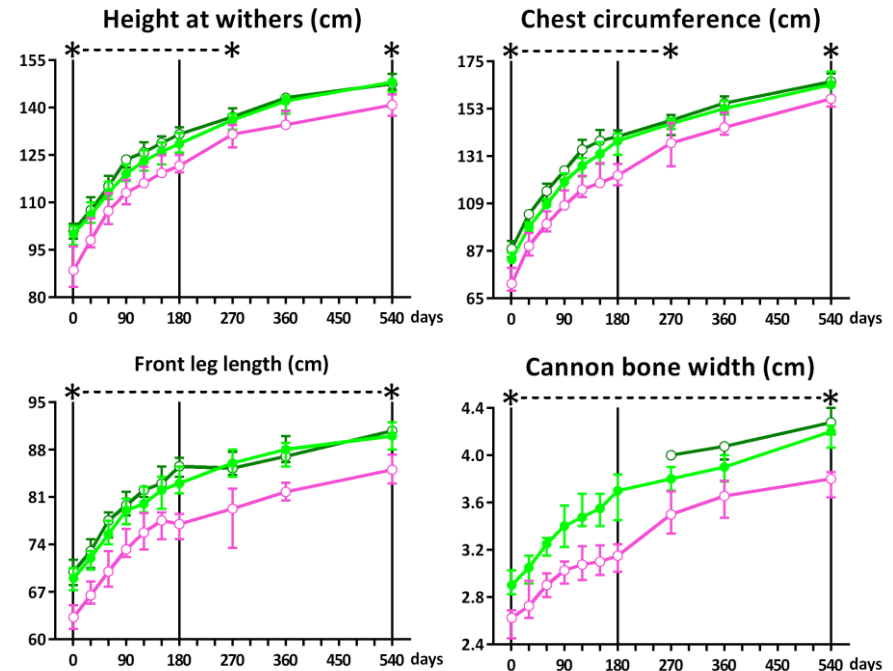

SB-in-Pony foals - restricted

Models of restricted fetal growth

“Restricted” saddlebreds
(S-in-P, n=6)

Control saddlebreds
(S-in-S, n=28)

“Enhanced” saddlebreds
(Saddle-in-Draft, n=8)

Peugnet et al, J Eq Vet Sci, 2016, see also Allen et al. 2002

Growth of “restricted” foals (Saddlebred-in-Pony) is slowed until weaning, then a disharmonious catch-up growth occurs.

Models of restricted fetal growth

“Restricted” saddlebreds
(S-in-P, n=6)

Control saddlebreds
(S-in-S, n=28)

“Enhanced” saddlebreds
(S-in-D, n=8)

Newborn - age 3 days

IV glucose
tolerance test

Weanling - age 200 days

Hyperinsulinemic
euglycemic clamp

Yearling - age 540 days

Hyperinsulinemic
euglycemic clamp

Birth
Day 0

Weaning
Day 180

1 year
Day 360

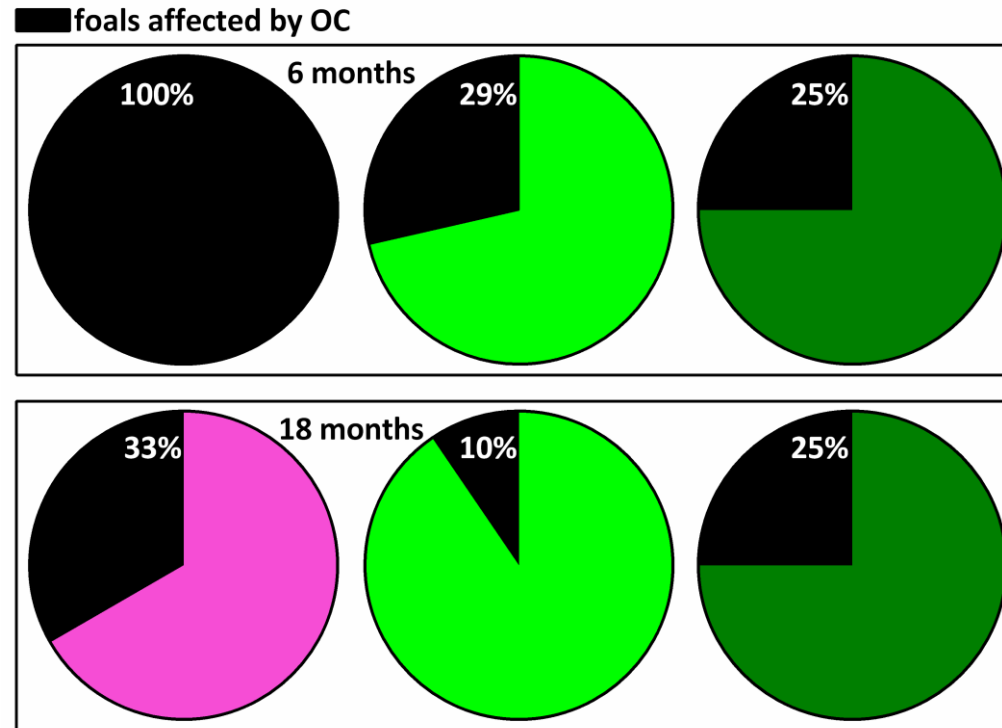

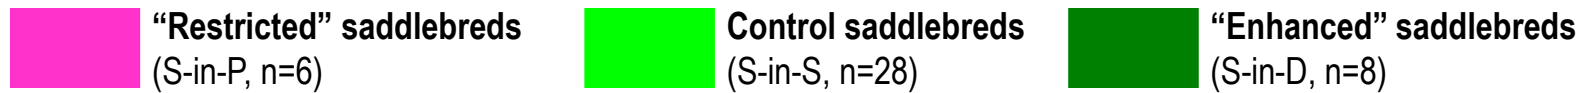

End of monitoring
Day 540

“Restricted” foals (Saddlebred-in-Pony) are more sensitive to insulin until weaning, but the effect disappears by age 1 year ½.

Peugnet et al, PLoS ONE, 2014; Peugnet et al, J Eq Vet Sci, 2016; Forhead et al, J Endocrinol, 2004

Models of restricted fetal growth

Peugnet et al, J Eq Vet Sci, 2016

“Restricted” foals (Saddlebred-in-Pony) have an increased risk of osteochondrosis at age 6 months, but not any more at 18 months of age

In summary

| | Enhanced ponies | Restricted horses |
|------------------------|--|--|
| Environnement maternel | <ul style="list-style-type: none"> ↗↗ uterine capacity ← Maternal glycemia reduced /ponies ← ↗↗ milk production ← | <ul style="list-style-type: none"> → ↘↘ uterine capacity → Maternal glycemia higher / SB or TB → ↘↘ milk production |
| Croissance foetale | INCREASED ← | → RESTRICTED |
| Croissance placentaire | <ul style="list-style-type: none"> Large placentas ← No functional adaptation ← | <ul style="list-style-type: none"> → Small placentas → ↘↘ <i>IGF-II</i> et <i>SNAT2</i> expression |
| Croissance postnatale | AMPLIFIED / HARMONIOUS ← | → SLOW / DYSHARMONIOUS CATCH-UP |
| Homéostasie glucidique | <ul style="list-style-type: none"> Hypoglycemia ← ↗↗ NEFA concentrations ← Early insulin resistance ← Later on, insulin resistance as for ponies ← | <ul style="list-style-type: none"> → Hyperglycemia → ↘↘ NEFA concentrations → Early improved insulin sensitivity → Later on, insulin sensibility as for SB |
| Ostéocondrose | No effect on osteochondrosis (but ponies) ← | → More osteochondrosis at 6 months of age |
| Triiodothyronine | ↘↘ T3 concentrations ← | → ↗↗ T3 concentrations |

**1. SETTING THE SCENE : DOHAD, EPIGENETICS AND
CRITICAL PERIODS**

2. PROOF OF CONCEPT IN EQUIDAE

3. IMPORTANCE FOR HORSE BREEDING

4. CONCLUDING REMARKS

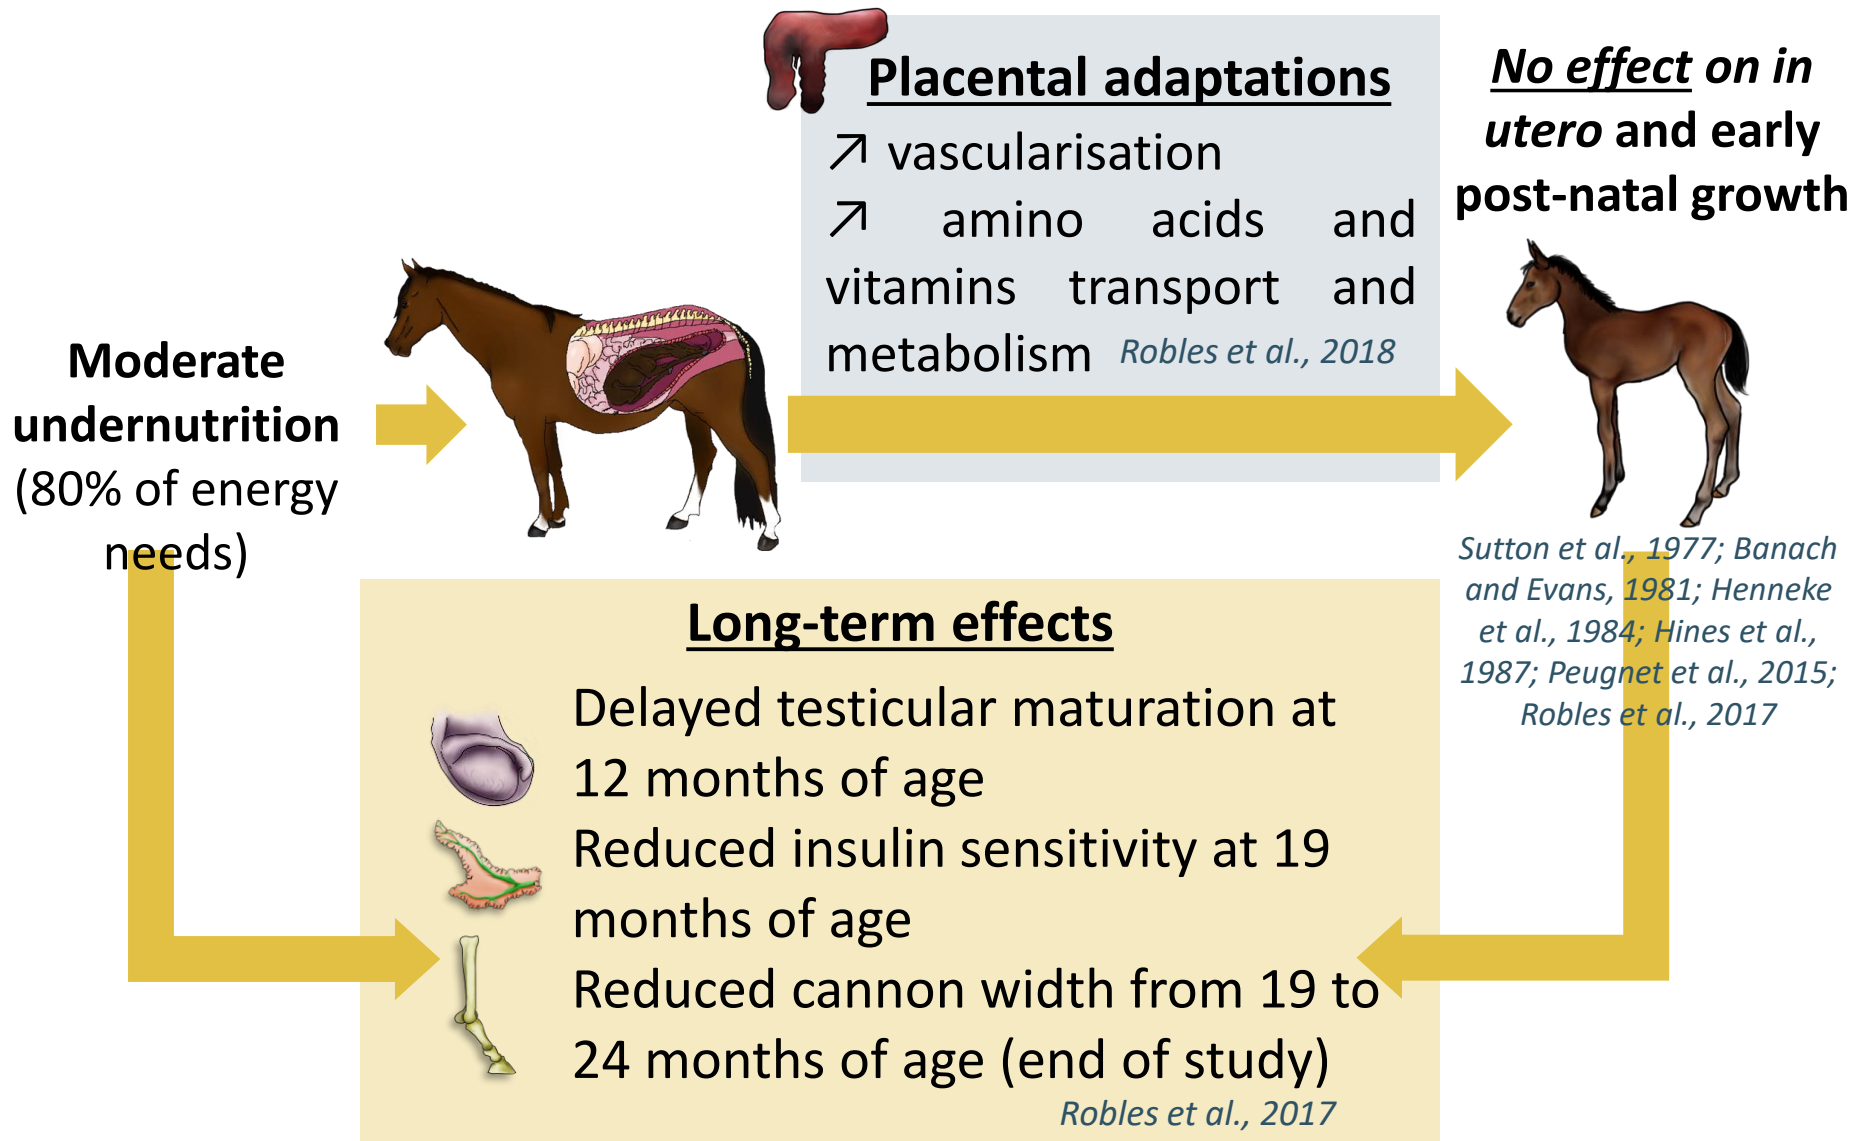

Obvious importance for embryo transfer

The recipient mare should be of the same size / breed as embryo

Effect of maternal undernutrition on health of foals

Effect of maternal undernutrition on health of foals

Severe
undernutrition
(*Streptococcus equi*)

Robles et al. 2018

Effect of maternal overnutrition and obesity on health of foals

Obesity from early gestation

Insulin resistance, low-grade inflammation

Robles et al., 2018

Early gestation

Placental adaptations

Robles et al. in preparation

Whole gestation

↘ milk production?

Robles et al. in preparation

Modification of milk quality (fatty acids)

Endometrium: inflammation and cytokines,

Lipid regulation, mitochondrial stress

Embryos: inflammation, lipid regulation,

ER, oxidative and mitochondrial stress

Altered uterine environment and embryo development at 8 and 16 days post ovulation

Sessions-Bresnahan et al., 2018

↗ low-grade inflammation until 6 months

↗ insulin resistance at 6 and 18 months

↗ osteochondrosis at 12 months

Robles et al., 2018

Both under & overnutrition alter long-term offspring health

Quantity of starch in the pregnant mares

Maternal hyperglycemia and increased insulin resistance
Peugnet et al. Plos One, 2015

Foal and placental biometry not affected at birth

Placental morphological and gene expression modifications similar to observed in the placenta of diabetic women or of mares with laminitis
Robles et al. Placenta, 2018

↘ colostrum quality

↗ insulin resistance

Increased risk of developing osteochondrosis

Caure and Lebreton, 2004; Vander Heyden et al., 2012; Peugnet et al., 2015

Quantity of starch in the pregnant mares

BUT

- Quality of forage,
- Quantity of forage

Are often insufficient to meet nutrients needs in pregnancy

→ Distribution of concentrated feeds remains important during gestation

Is it possible to provide enough energy to broodmares without affecting the health of their future foals?

Quantity of starch in the pregnant mare

Flattened barley

Last 4.5 months of gestation

0g starch
/100kgBW/meal

167g starch
/100kgBW/meal

Increased number of foals with osteochondrosis lesions at 6 months of age

Peugnet et al., 2015

Flattened barley

Last 2 months of gestation

MAX 75g starch
/100kg BW/meal
(n=5)

MIN 110g starch
/100kg BW/meal
(n=5)

Increased number of foals with osteochondrosis lesions at 12 months of age

Robles et al., unpublished

Quantity of starch in the growing foal

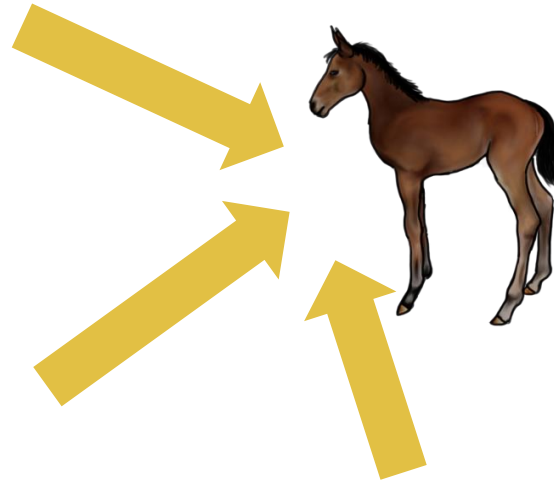

Mendoza et al., 2016

**Glycemic and
insulinemic response**

*Ralston, 1996, Pagan et al., 2001
Peugnet et al., 2015, Caure and
Lebreton, 2004*

Increased risk of developing
osteochondrosis

**Excessive growth rate
Overnutrition**

Donabedian et al., 2006

**Maximum amount of starch for pregnant mares and growing
foals: 100g/100kgBW/meal**

Fat and fatty acids

Limits of presented studies: Diets richer in starch are also richer in energy

- Starch amount ?
- Energy amount ?
- Starch x energy ?

Diet rich in starch

Corn, >100g starch / 100kgBW / meal

Diet rich in fat

Corn oil 14% fat, <15g starch / 100kgBW / meal

- ↗ basal plasma glucose and insulin concentrations until 80 days of age
- ↗ insulin resistance at 160 days of age

George et al., 2009

Fat may be a good source of energy to decrease the amount of starch in diet of pregnant mares

Fat and fatty acids

Supplementing diet of stallions with ω -3

Immunomodulatory properties
Foetal neuronal development
Fertility
Infla

Improves sperm quality in stallions

Brinsko et al., 2005,
Freitas et al., 2016

Supplementing diet of mares with ω -3

Algae or fish source 

Early gestation

- ↗ hospitable uterine environment
- ↗ embryo and trophoblast development

Jacobs et al., 2018

Late gestation & lactation

- ↗ ω -3 (EPA) in milk 
- ↗ DHA transfer at birth
- ↗ social behaviour, memory and learning ability

Adkin et al., 2013, Adkin et al., 2015, Hodge et al., 2017

No effect: colostrum Ig concentration (*Adkin et al., 2013, Hodge et al., 2017*), gestation length (*Adkin et al., 2013*), placental and foal weight at birth (*Feirrer et al., 2012, Adkin et al., 2013*), interval to first postpartum ovulation (*Adkin et al., 2013*).

Growing foals
Excess proteins

Proteins and amino acids

No effect on development of osteochondrosis

Savage et al., 1993

In other species ... (humans, mice, cows, pigs...)

**Inadequate intake of proteins/amino acids
(excess or deficiency)**

Behaviour

Food intake
Taking risk behaviour

Health

Intrauterine growth restriction
Development of: Skeletal muscle,
thymus gland, bone, hypothalamic-
pituitary-gonadal axis
Glucose metabolism
Regulation of blood pressure

Lifespan

Depends on growth
during early life

Chen et al., 2009; Jahan-Mihan et al., 2015; Herring et al., 2018

Proteins and amino acids

L-arginine Wu et al., 2009

Essential during pregnancy and growth in horses

Abondant in mares' milk compared to other species Davis et al., 1994

Protein synthesis

Creatine
Glucose tolerance

Nitric oxide
Vascularization

Urea cycle-Ornithine-
Polyamines
Growth factors

Early gestation

0.0125% of BW (68g) - from 15 to 45 days after ovulation

No effects on embryo size, increased early growth at D45?

Aurich et al., 2019

Arginine supplementation

Late gestation

Last 4 months of gestation (100g/d) *Robles et al., 2019*

- ↗ physiological insulin resistance in response to pregnancy in primiparous mares
- ↗ birthweight of foals born to primiparous dams
- ↗ placental gene expression of *GLUT1* and *CD36* in primiparous placentas

21 days before foaling (100g/d) *Mortensen et al., 2011*

- ↗ uterine artery bloodflow (non-pregnant horn)
- ↘ gestation length (-12 days)
- No effect on foal and placental weight at birth

**Improves sperm
quality in humans**

*Stanislavov et al., 2014,
Kobori et al., 2015*

Lactation (50g/d) *Hunka et al., 2016*

- No effect on milk composition
- No effect on growth of foals
- No effect on adiposity of foals

**1. SETTING THE SCENE : DOHAD, EPIGENETICS AND
CRITICAL PERIODS**

2. PROOF OF CONCEPT IN EQUIDAE

3. IMPORTANCE FOR HORSE BREEDING

4. CONCLUDING REMARKS

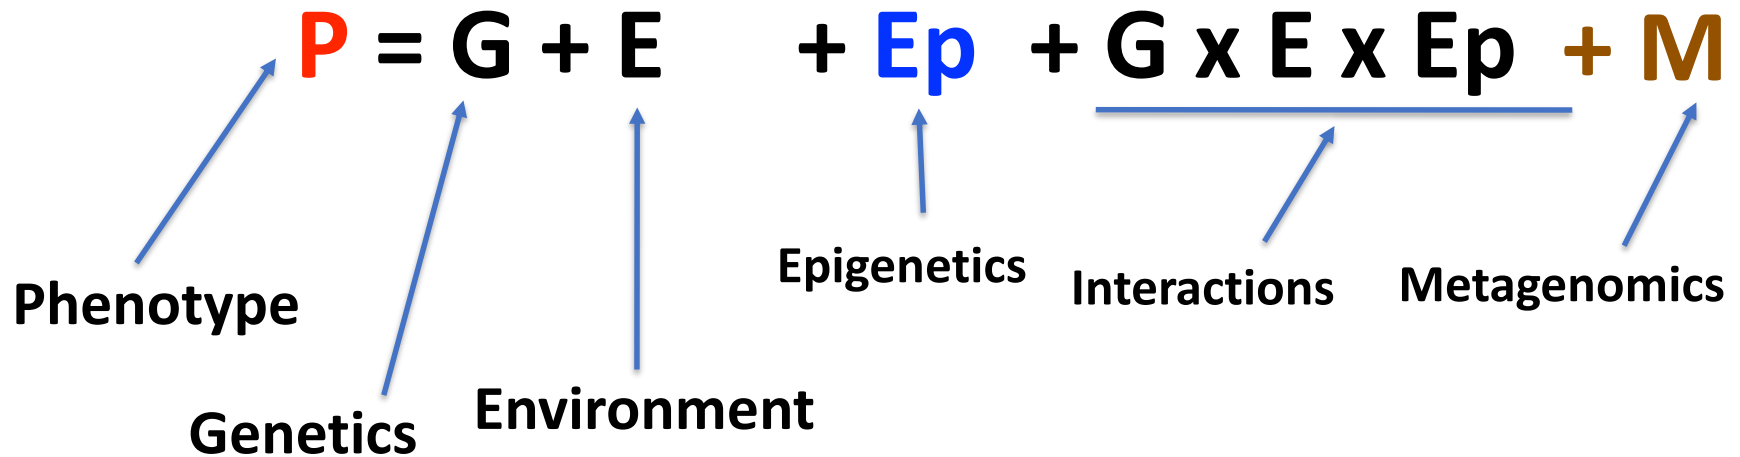

Conclusion

- The effects of prenatal environment are so far probably underestimated and need to be further evaluated
- The choice and nutrition of the dam (and stallion...) are essential
- Markers of prenatal programming are urgently needed, as well as epigenetic tools in equidae €€€€€

Because...

The origins of the phenotype

Show jumping performance (*Palmer et al. 2018, 2019 abstracts; Robles et al in preparation*)

| Random effect | % of the variance explained |
|--|-----------------------------|
| Genetic value for performance | 24.6 % |
| Genetic « maternal value » (concerns recipient in case of ET) | 1.4% |
| Permanent environment of individual horse (explains partly repeated successive performance) | 23.4% |
| Common environment of offspring of the same mare (concerns recipient in case of ET) | 1.6% |
| Residual | 49.6% |

Growth rate of foals

Donabédian et al., 2006

Fast growth rate is linked to osteoarticular diseases

Donabédian et al., 2006; Lepeule et al., 2009; Makvandi-Nejad et al., 2012; Teyssedre et al., 2012; Orr et al., 2013; Naccache et al., 2018

Normal growth rate is not a marker of osteoarticular diseases

Peugnet et al., 2015; Robles et al., 2018

↗ OC+ foals at 12 months of age

↗ OC+ foals at 6 months of age

Interests of vitamin supplementation

Improves sperm quality in stallions

Denniston et al., 2000

Deichsel et al., 2008

Gee et al., 2008

Freitas et al., 2016

Natural vitamin E

RRR- α -tocopherol, 1678mg/day

Last 3 months of gestation

Hoffman et al., 1999,

Bondo et al., 2011

Colostrum, milk and plasma of neonatal foals

and IgM colostrum concentration

and foal plasma concentration at 3 days of age

Oocyte and embryo quality?

Beta-carotene

1000mg/day

Kuhl et al., 2012

From 2 weeks before foaling until 6 weeks after

↗ β -carotene in colostrum and plasma foals at 1 day of age

Supplementation of liposoluble vitamins improves the colostrum quality

Role of antioxidants in placental and fetal development ?

Calcium and phosphorus

Phosphocalcic ratio (Ca/P)

Between 4 and 8 months of age

Optimal: 1.7

High: 5.7

Low: 0.4

Savage et al., 1993

Pregnancy ? Lactation ?

Copper and zinc

Osteoarticular diseases

- Plasma copper concentration below normal
- Occasionally zinc toxicosis
- Low copper storage in liver

Carbery et al., 1978, Bridges et al., 1984, Van weeren et al., 2003, Coskun et al., 2016

Foals between 3 and 9 months of age

High Copper
25ppm
3 lesions

Low Copper
8ppm
29 lesions

Hurtig et al., 1993

Copper deficiency is associated to development of osteochondrosis lesions in foals

So... Supplementing the mare of the foal ?

21 Thoroughbred mares *Pearce et al., 1998*

REMINDER – NRC RECOMMENDATIONS

9 months → 0.2mg/kgBW

Then 0,25mg/kgBW

Control

0.1 to 0.2 mg/kgBW

Cu+

+0.5 mg/kgBW

0.6 to 0.7 mg/kgBW

3 to 6 months before foaling

Control

Cu+

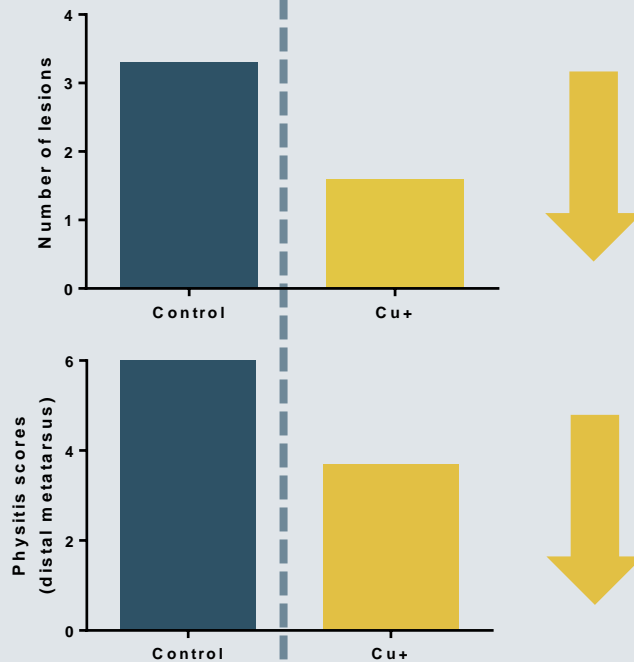

Control

Cu+

So... Supplementing the mare of the foal ?

Maternal supplementation

Decreased number and severity of lesions in supplemented group

Foal supplementation

No difference

Pearce et al., 1998

So... Supplementing the mare or the foal ?

BOTH

to avoid copper deficiencies

BUT

Pregnant mares (especially during the 3 last months of gestation) will benefit from supplementation above the recommendations

With respect to the balance between copper and zinc

Selenium

Delesalle et al., 2017

**Selenium
deficiency during
pregnancy** →

Lofstedt, 1997

White muscle disease

Myodegenerative pathology
Affecting skeletal and cardiac muscles
Lead to death of foal in most cases

Form of selenium

Selenium yeast

0.65ppm vs 0.35ppm/day
Last 4m of gestation

↗ Se concentration in plasma and
muscles (*Karren et al., 2010*)

↘ Leptin plasma concentration
36h after birth (*Cavinder et al., 2012*)

No effect on glutathione
peroxidase

Selenomethionine vs. Sodium selenite

2mg/day

Last 3m of gestation and 1stm of lactation

↗ Se in milk at 7 and 30 days of lactation

↗ plasma Se and specific alkaline
phosphatase concentration at 30 days

↗ blood glutathione peroxidase activity
at 30 days of age (*Leleu et al., 2017*)

The image shows two ancient clay horse figurines displayed on a grey museum platform. The larger figurine on the right is a horse with its head turned back, showing its teeth. The smaller figurine on the left is a foal. The background is a plain, light-colored wall. A semi-transparent grey banner with white text is overlaid across the middle of the image, and a yellow banner with black text is at the bottom.

PART 3 : EARLY MARKERS TO PREDICT THE DEVELOPMENT OF THE FOAL

*Pascale CHAVATTE-PALMER,
UMR BDR, INRA, ENVA, Université Paris Saclay, 78350, Jouy en Josas, France*

Conclusion...

+ Large variations depending on genotype

1 The environment affects the gametes (F0)

Embryo to fetal development

Genotype / Epigenotype interactions....

+microbiota...

2 Embryo development and epigenetic marks are affected

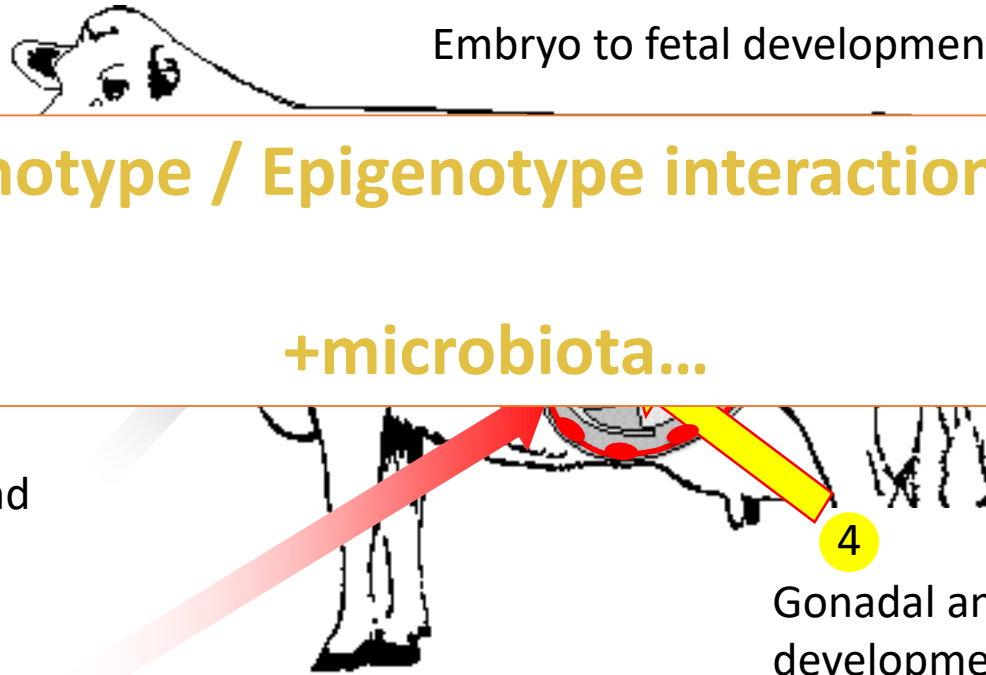

3 The placenta regulates fetal growth and nutrition (F1) and adapts according to the fetal sex. Fetal adaptive mechanisms are conveyed by epigenetic marks

4

Gonadal and gamete development may be affected, thus having an effect on the next generation (F2) (inter-generational effects)

5

Epigenetic modifications in the gametes induce trans-generational effects (F>2)

1. REPRODUCTION: IMPORTANCE OF THE DAM

More complex and complete methods are needed

Euglycemic
hyperinsulinemic clamps

IVGTT

OGTT

FSIGT

IVGTT: Intravenous Glucose Tolerance Test

PROCEDURE

- Fasting sampling
- Intravenous glucose injection (250mg/kg)
- 3 hours sampling

ANALYSES

- Normalization
- Area under the curve of glucose and insulin plasma concentrations
- ✓ **Glucose clearance**
- ✓ **Insulin release**

FSIGT: Frequently Sampled Intravenous Glucose Tolerance Test

Simultaneous estimation of insulin sensitivity and glucose tolerance through the calculation of quantitative indexes.

- Insulin sensitivity (SI)
- Short term pancreatic production of insulin (AIRg)
- Glucose mediated glucose transport (Sg)
- Whole body insulin sensitivity ($DI=SI*AIRg$)

Black box mathematic model

(Bergman et al., 1989, Boston et al., 2003)

- Basal sampling
- Intravenous glucose injection (100 mg/kg)
- Sampling for 19 min *Toth et al., 2009*
- **20 min, intravenous insulin injection (20 mUI/kg)**
- 3 hours sampling

Maternal insulin sensitivity

- ↳ SI
- ↗ Glucose absorption
- ↗ Pancreas insulin production

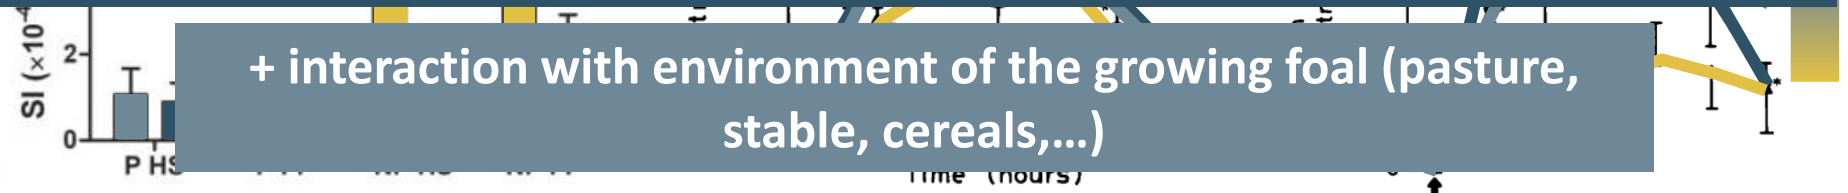

Pregnancy

+ differences between breeds and seasons (Funk et al., 2012; Bamford et al., 2014; Peugnet et al., 2014, Beythien et al., 2017)

Fowden et al., 1984; Hoffman et al., 2003; Peugnet et al., 2015; Beythien et al., 2017

Need to develop reference charts according to stage of gestation, age, parity and breed of the mare

NOT PREDICTIVE

Two examples ...

Foals born to mares fed with forage only or forage and barley

- ↗ glucose tolerance 3 days of age ↘ insulin sensitivity 19 months of age

Peugnet et al., 2015; Robles et al., 2017

Foals born to obese or normal mares

Robles et al., 2018

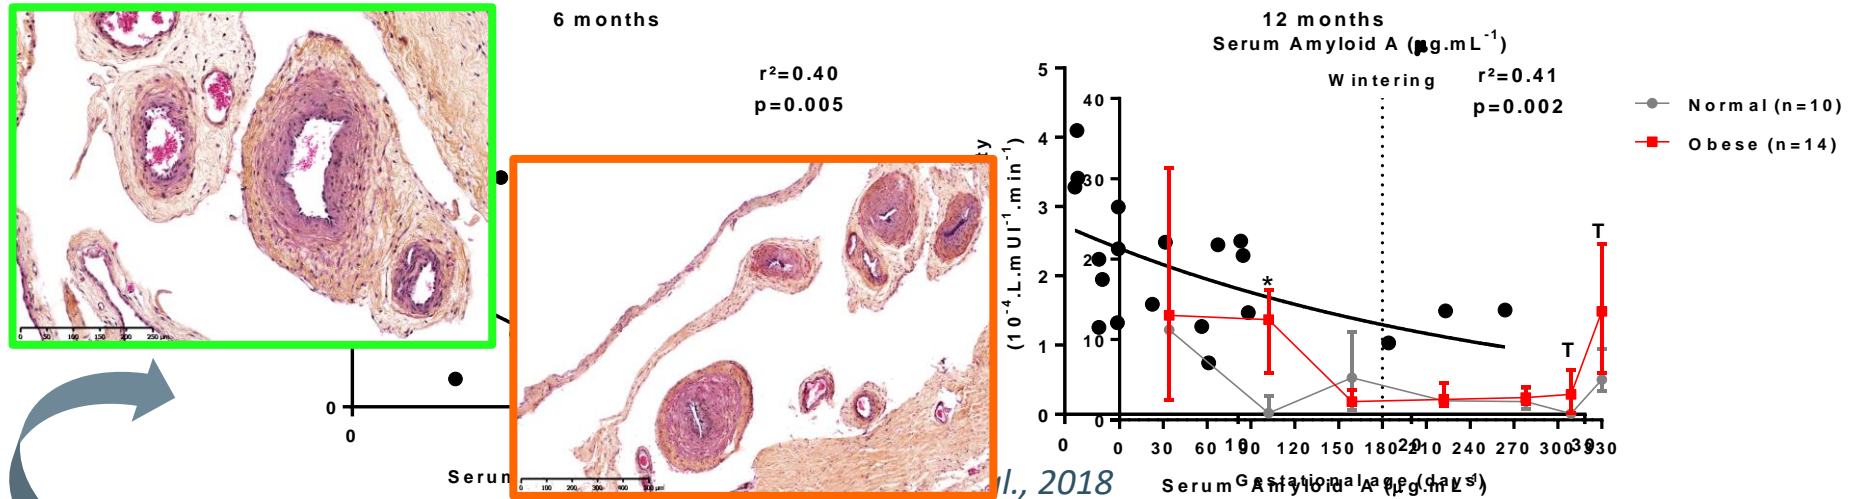

1. REPRODUCTION: IMPORTANCE OF THE DAM

**2. MONITORING THE BODY CONDITION AND METABOLISM
OF THE PREGNANT MARE**

3. PLACENTA MARKER OF PREGNANCY DISORDERS

Maternal systemic inflammation

Insulin resistance is correlated to systemic inflammation

Maternal and placental inflammation

↗ Osteochondrosis lesions

Robles et al., 2018, Placenta; Robles et al., 2018, PLOS ONE

Measurements of placentas and foals at birth

Weight + placental efficiency

Surface

*Peugnet et al., 2014, PLOS ONE; Robles et al., 2018, Placenta
Robles et al., 2018, Equine Veterinary Journal; Robles et al., 2018, Theriogenology*

Volume

NOT GOOD PREDICTIVE MARKERS

Measurements

- Strongly correlated to maternal wither's height (*Allen et al., 2002, Robles et al., 2018*)
- ↘ in primiparous pregnancies (*Wilsher and Allen, 2003; Elliott et al., 2009; Meirelles et al., 2017; Robles et al., 2018*)
- ↘ in very young and old mares (*Elliott et al., 2009*)

Measurements of placentas and foals at birth

NOT GOOD PREDICTIVE MARKERS

BUT

Examine carefully the placenta: missing parts, white patches, abnormal coloration of the villous side

When measurement strongly differ from expectations

Intra uterine growth retardation

Weight below the 10th percentile

Embryo transfer between breeds

Affects: Primiparity

- Metabolism
- Osteoarticular development
- Reproductive maturity
- Cardiovascular function

Giussani et al., 2003; Forhead et al., 2004; Peugnet et al., 2014, 2016; Robles et al., 2017

Overgrowth

Weight above the 90th percentile

Embryo transfer between breeds

Affects:

- Metabolism
- Cardiovascular function

Giussani et al., 2003; Forhead et al., 2004; Peugnet et al., 2014, 2016

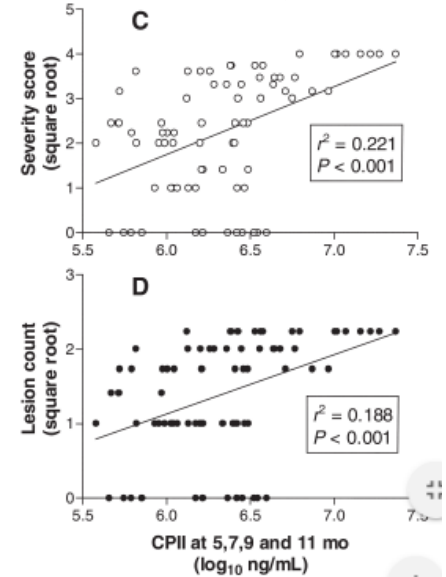

Blood markers of osteochondrosis ?

Not observed in all studies (Peugnet et al., 2016)

Clark Billinghamurst et al., 2004

Serteyn et al., 2014

No correlation between CTX-II, Bone-specific alkaline phosphatase and hydroxyproline, markers of collagen synthesis and degradation, and osteochondrosis lesions

Nicholson et al., 2010; Peugnet et al., 2016

Role of colostrum quality ?

Composition colostrum vs milk

Energy: ↗ fatty acids (especially long-chain saturated), ↗ proteins (whey proteins, free amino acids),

Vitamins and minerals: ↗ zinc and copper, ↗ liposoluble vitamins,

Immune system: Immunoglobulines, native immune cells and cytokines, oligosaccharides

Csapo-Kiss, et al., 1995; Pikul et al., 2007; Burton et al., 2009; Secor et al., 2012; Perkins et al., 2014, Difilippo et al., 2015; Robles et al., unpublished

~~Starch intake~~

Caure and Lebreton, 2004; Robles et al., unpublished

↘ colostrum quality

↘ IgG

↗ concentration in palmitic (C16:0) and linoleic acids

(ω6) fatty acids

Direct or indirect effect ?
Maternal metabolism
Transplacental transfer
