Study Design

- Experimental period: 0-56 days
- Breed: Hubbard JA757
- 8 treatments X 8 replicates

Experimental facility:
Wageningen
Bioveterinary Research,
Lelystad, WUR, The
Netherlands

Dietary Treatment

Stand. Diet with Soybean (Ref)

1% BSF meal

5% BSF meal

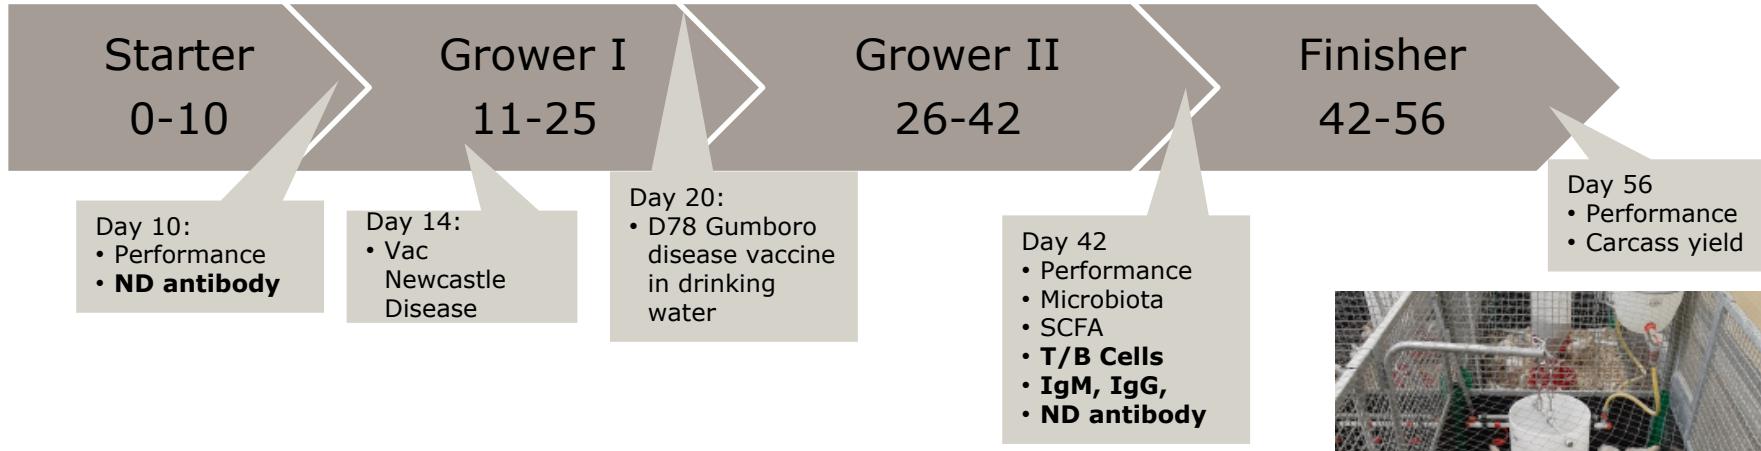

1% BSF meal with extra chitin

5% BSF meal with extra chitin

1% BSF oil

2.5% BSF oil

Experimental Period

Immune measures

Blood samples collected in day 42

- subsets cell population of **T lymphocytes** (CD4+, CD8+, CD4+ CD8+), **B cells**, **leukocytes** (CD45+), and **natural killer cells** (NKC)
- antibody titers to New-Castle Disease Virus
- immunological markers like IgA, IgM & IgY

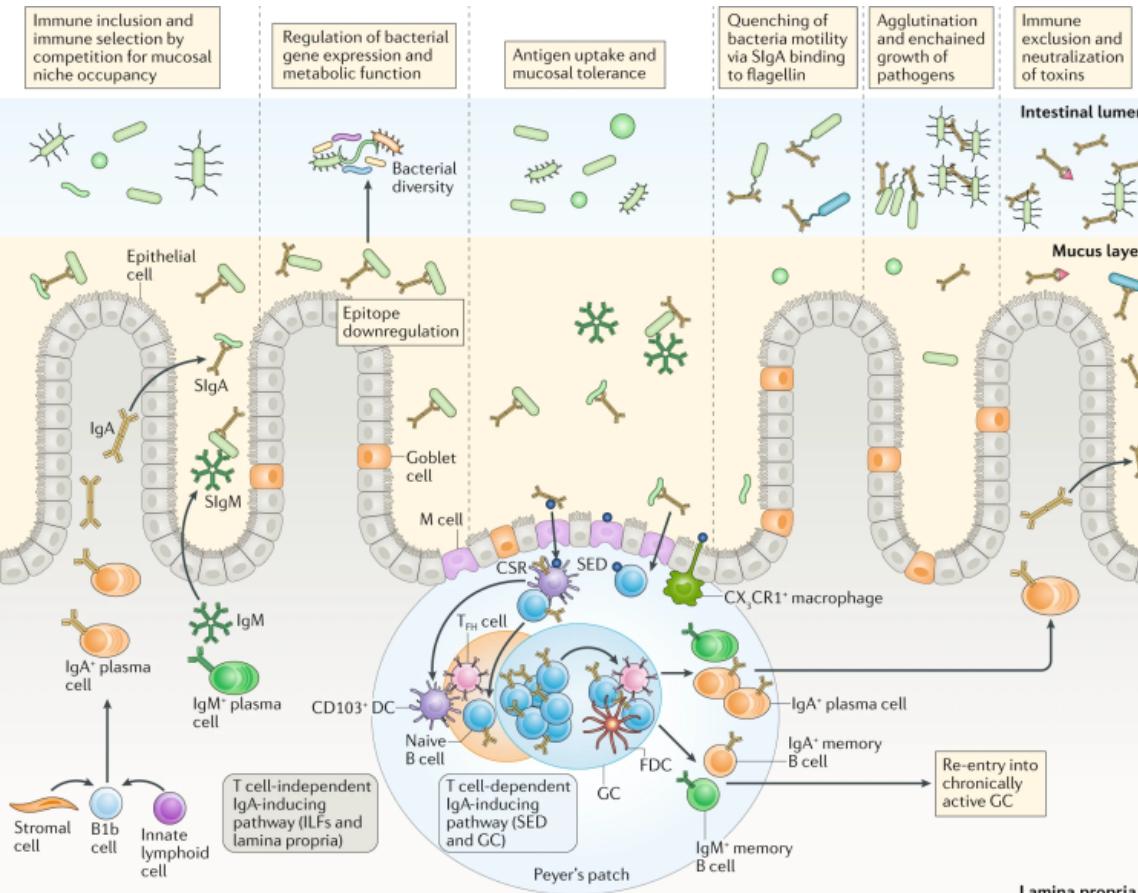

Results

	Control	1% BSF meal	5% BSF meal	1% BSF meal PLUS	5% BSF meal PLUS	1% BSF oil	2.5% BSF oil	F-prob

Quantification and distribution of chicken immunoglobulins IgA, IgM and IgG in serum and secretions

[Anne-Marie Lebacq-Verheyden](#), [J.-P. Vaerman](#), and [J. F. Heremans](#)

► Copyright and License information [PMC Disclaimer](#)

Abstract

IgA was found to be present in **chicken serum** in a concentration of 0.33 mg/ml, thus representing less than **4 per cent** of **total immunoglobulins**. Of this amount, **about 20 per cent** appeared to be **monomeric**, most of the rest consisting of **polymers greater than dimers**.

Conclusion

Low inclusion level of BSF in slow growing broiler chicken diet resulted in a higher humoral immunity

Implications

Further research is needed to determine the efficacy and mode-of-action of BSF and BSF derived products on humoral immune system in chicken

- Hypothesis to be tested:
 - Direct interaction of BSF- *ex vivo* and/or *in vitro*
 - Indirect interactions of BSF – studying the presence and function of microbiome
