

# ***Simplified method developed for estimating the on-farm GHG and NH<sub>3</sub> emissions*** **Presentation and Results**

*Vergé X., Robin P., Becciolini V., Cieslak A., Edouard N., Fehmer L., Galama P., Hargreaves P.,  
Juškiene V., Kadziene G., Lissy A.-S., Ruska D., Szumacher M.*

# *Road map...*

- *I. Development of the “Simplified Method”*
- *II. Results based on an international study*
- *III. Interest and perspectives*

## • I. Development of the “Simplified Method”

### Objectives :

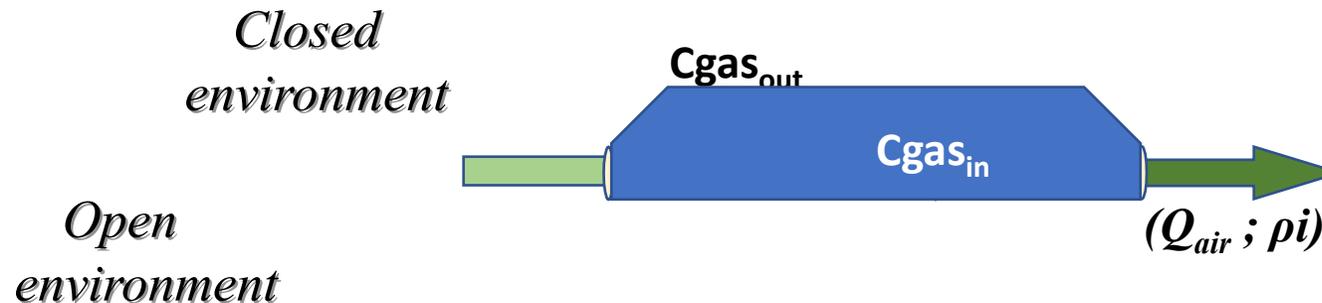

Gas emission estimates ( $\text{NH}_3$ ,  $\text{CO}_2$ ,  $\text{CH}_4$ ,  $\text{N}_2\text{O}$ ) in open barns, for non-expert people, at low costs

### The issue :

Calculations with air fluxes and gas concentration gradients :

$$\text{Emissions}_{\text{Gas}} = (Q_{\text{air}} \times \rho_i) \times (C_{\text{gas}}_{\text{in}} - C_{\text{gas}}_{\text{out}})$$

- $Q_{\text{air}}$  : air flow rate
- $\rho_i$  : air density
- $C_{\text{gas}}$  : gas concentration

In open barns how to estimate the air flow rate in a simple way so that non-expert people can do it, and with acceptable costs ...?

## • I. Development of the “Simplified Method”

### Objective :

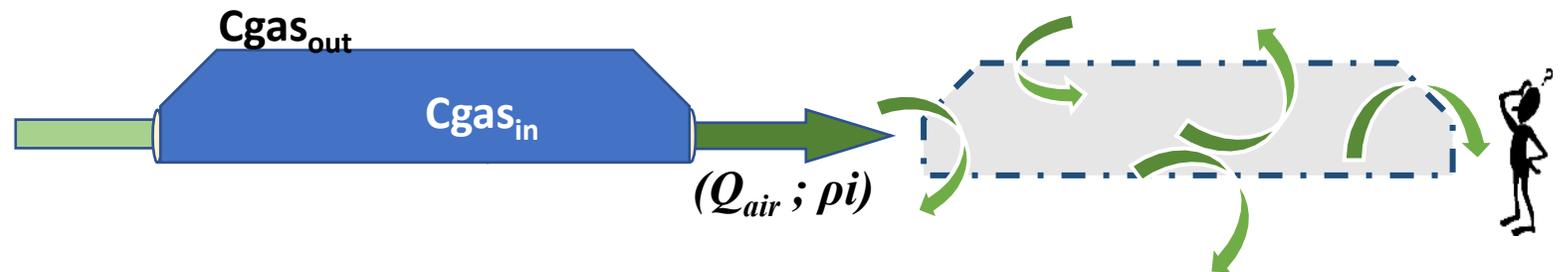

Gas emission estimates in open barns ( $\text{NH}_3$ ,  $\text{CO}_2$ ,  $\text{CH}_4$ ,  $\text{N}_2\text{O}$ )

### The issue :

Calculations with air fluxes and gas concentration gradients :

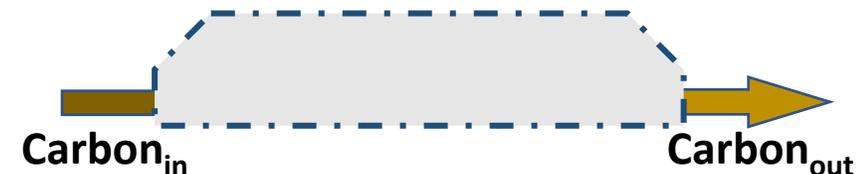

- $Q_{\text{air}}$  : air flow rate
- $\rho_i$  : air density
- $C_{\text{gas}}$  : gas concentration

$$\text{Emissions}_{\text{Gas}} = (Q_{\text{air}} \times \rho_i) \times (C_{\text{gas}_{\text{in}}} - C_{\text{gas}_{\text{out}}})$$

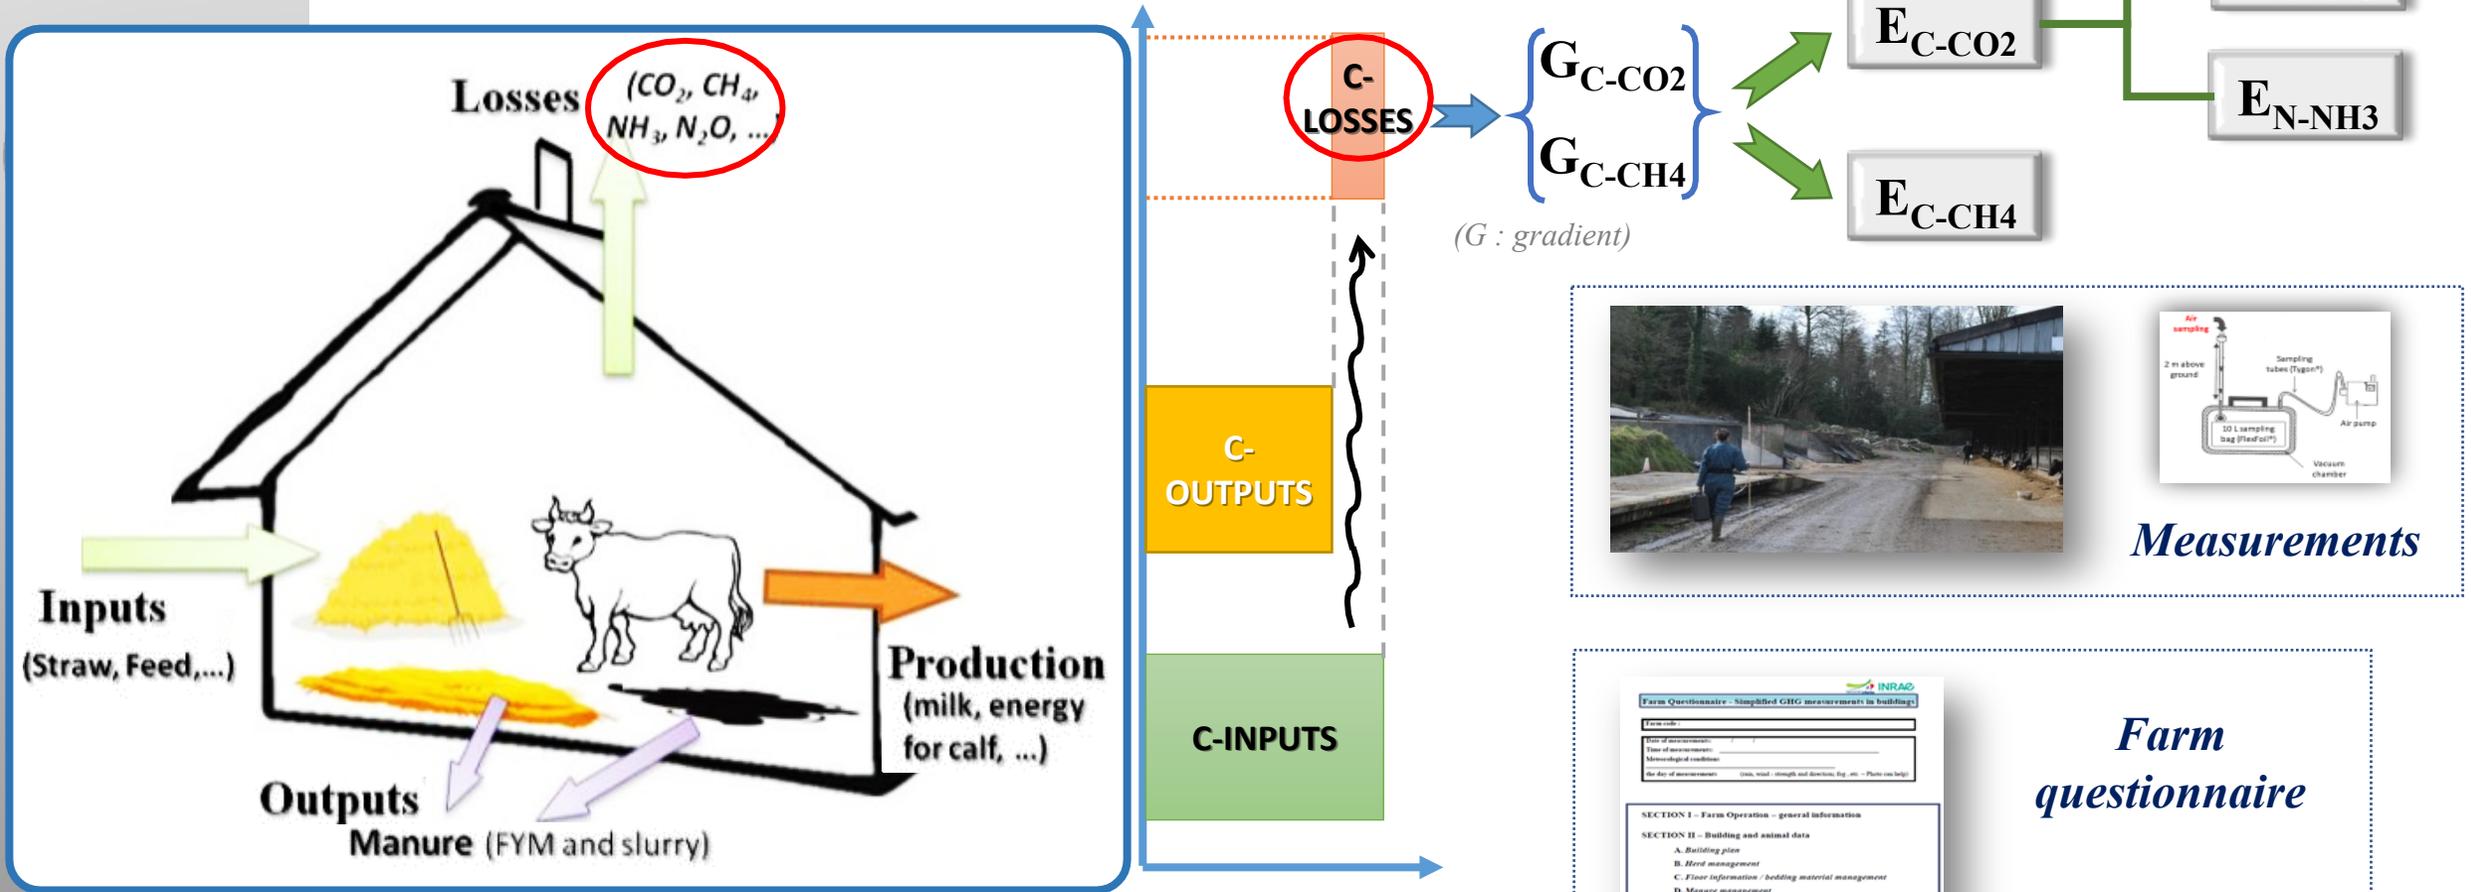

### Solution :

Replacing air flow rate measurements  
by estimating carbon budget in  
livestock buildings

• I. Development of the “Simplified Method”

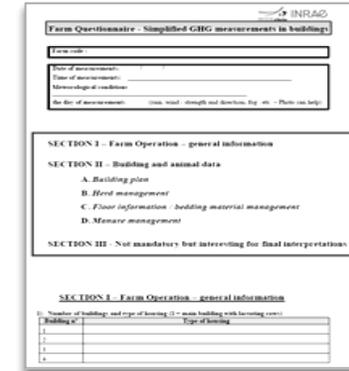

*Carbon budget  
Mass balance at the building scale*

## • I. Development of the “Simplified Method”

### Quality Control

**The first step of the method consist in checking all data input from the questionnaire**

**Farm Questionnaire - Simplified GHG measurements in buildings** INRAE

Form ID: \_\_\_\_\_

Date of measurement: \_\_\_\_\_

Measurement location: \_\_\_\_\_

No. of measurement: \_\_\_\_\_ (see, visit, strength and duration: Eq. 10 - Please see help)

**SECTION I - Farm Operation - general information**

**SECTION II - Building and animal data**

A. Building plan

B. Herd management

C. Floor information / bedding material management

D. Manure management

**SECTION III - Not mandatory but interesting for final interpretation**

**SECTION I - Farm Operation - general information**

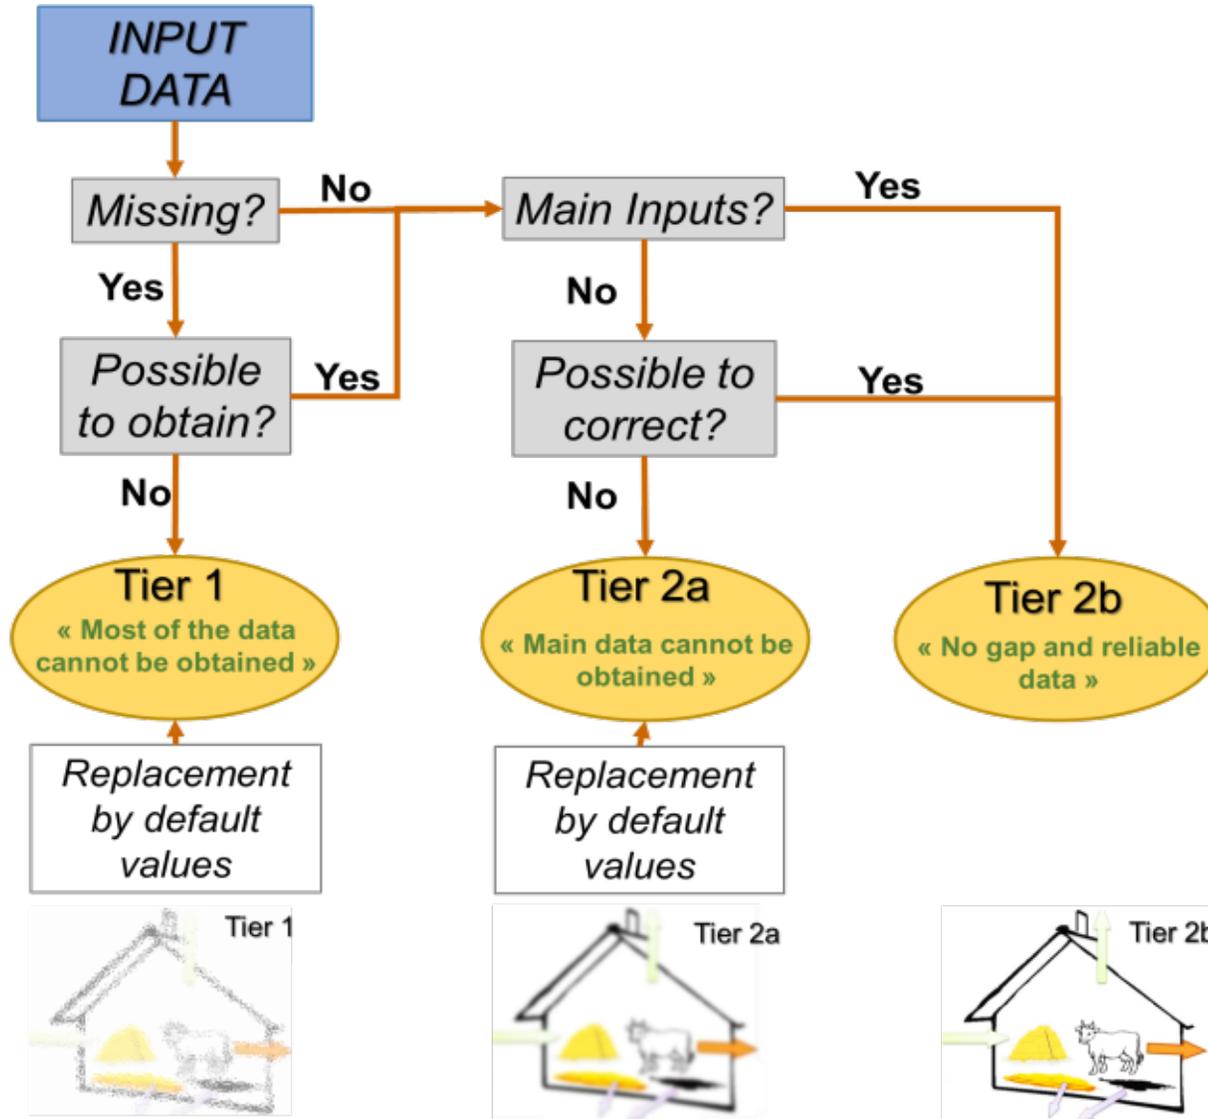

D. Number of buildings and type of housing (1 = main building with housing cows)

Building ID	Type of housing
1	
2	
3	
4	

**Depending on the level of data reliability three tiers have been defined:**

- Tier 1 : mainly based on default values  **Very Low farm precision**
- Tier 2a : important inputs based on default values  **Low farm precision**
- Tier 2b : no default value  **Good farm precision**

• I. Development of the “Simplified Method”

# *Road map...*

- *I. Development of the “Simplified Method”*
- *II. Results based on an international study*
- *III. Interest and perspectives*

• **II. Results (ClimateCareCattleFarming 2020-2023)**

CCCFarming is :

- 8 countries
- 60 dairy farms
- **264 measurements** and about 1 000 EF calculations
- With a wide range of dairy production systems :

- Housing**
- Cubicle, slatted floor
  - Cubicle, sloping straw floor
  - Cubicle, deep straw
  - Cubicle with sand bedding and rubber floor
  - Freewalk wood chips
  - Compost bedded pack barn
  - Compost barn, scraping alley
  - Tie stall, deep straw
  - Tie stall, scraping alley

### Manure output

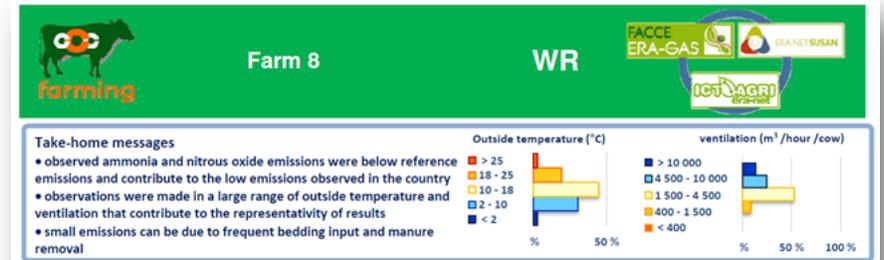

• *II. Results (CCCFarming 2020-2023)*

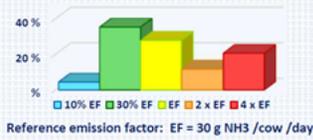

Left graphs show the country situation

Right graphs show the farm situation

**Observed emissions**

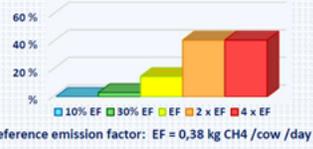

► **Ammonia emissions (g NH<sub>3</sub>/cow /day)**

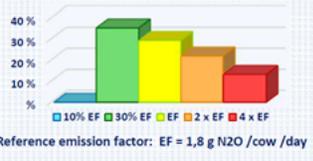

**Observations in my farm**

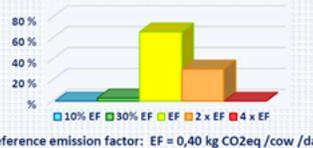

► **Methane emissions (kg CH<sub>4</sub>/cow /day)**

► **Nitrous oxide emissions (g N<sub>2</sub>O /cow /day)**

► **Greenhouse gas emissions (kg CO<sub>2</sub> eq /L milk)**

• *II. Results (CCCFarming 2020-2023)*

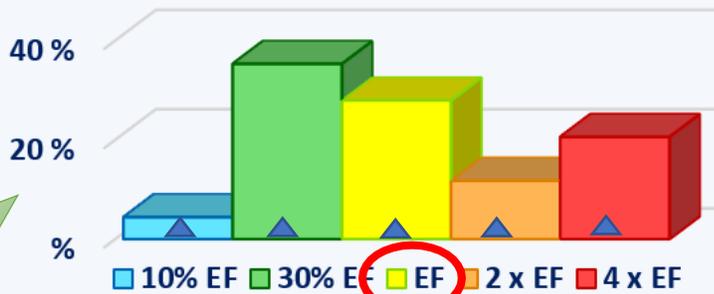

The farm (or country) is **NOT** characterized by only one EF for a specific year

**BUT** by the EF distribution over the year

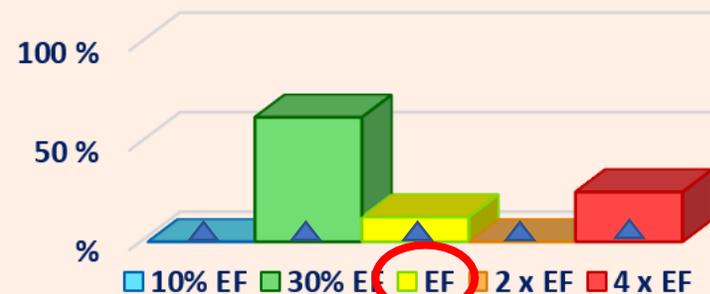

Observations

► *Ammonia emissions (g NH<sub>3</sub> /cow /day)*

Reference emission factor: EF = 30 g NH<sub>3</sub> /cow /day

Observations in my farm

min	max	min	max	min	max	min	max	min
0	4	4	15	15	45	45	101	101

Frequency

EFs distributed in 5 classes :

- 10% EF — Much lower
- 30% EF — Lower
- EF — Neutral
- 2x EF — Higher
- 4x EF — Much higher

It represents the « **signature** » of the farm over the year

- *II. Results (CCCFarming 2020-2023)*

OBJECTIVE

The objective of this method is to **point out « hot spots »** or **good practices**, compared to average results, to help implementing mitigation strategies

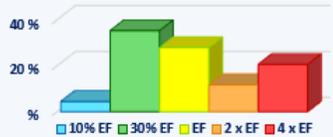

## • II. Results (CCCFarming 2020-2023)

EXAMPLE  
« HOT SPOT »

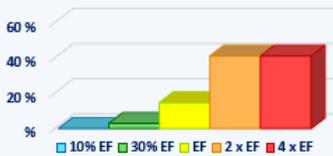

### Observed emissions

#### ► Ammonia emissions (g NH<sub>3</sub>/cow /day)

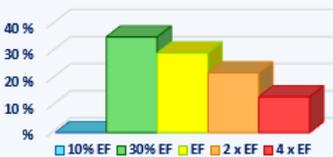

Reference emission factor: EF = 30 g NH<sub>3</sub>/cow /day

#### ► Methane emissions (kg CH<sub>4</sub>/cow /day)

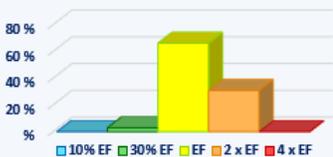

Reference emission factor: EF = 0,38 kg CH<sub>4</sub>/cow /day

#### ► Nitrous oxide emissions (g N<sub>2</sub>O/cow /day)

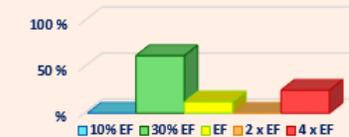

Reference emission factor: EF = 1,8 g N<sub>2</sub>O/cow /day

#### ► Greenhouse gas emissions (kg CO<sub>2</sub> eq /L milk)

Reference emission factor: EF = 0,40 kg CO<sub>2</sub>eq /L milk

#### The manure management

#### Manure output

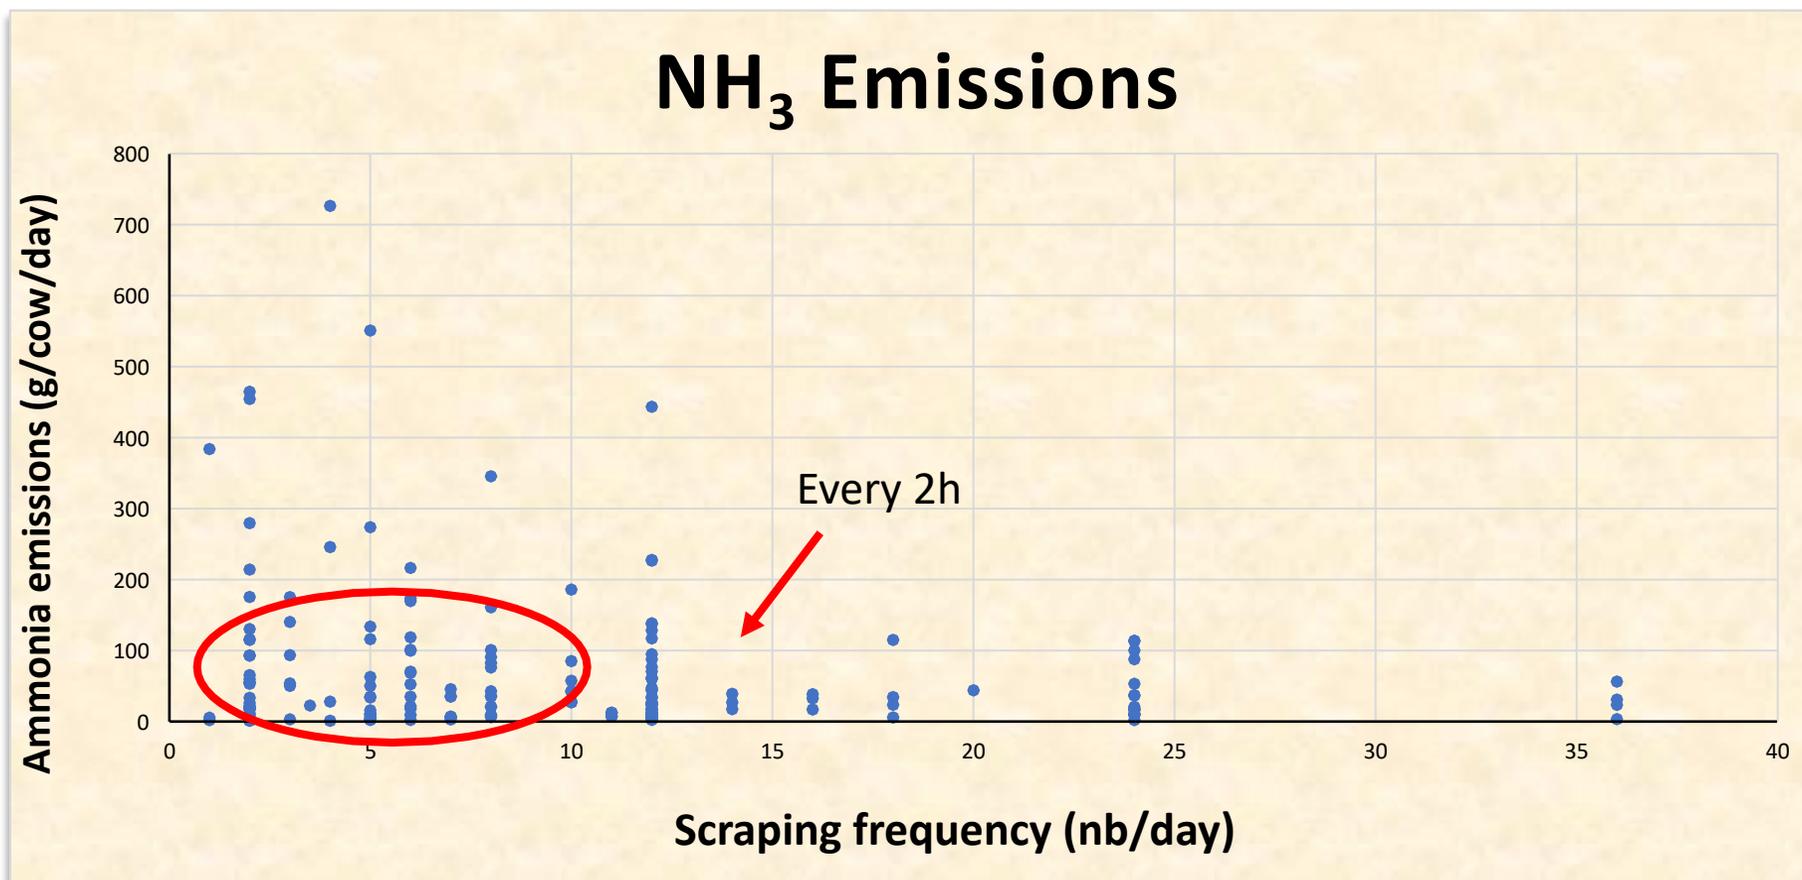

- liquid
- solid
- solid & liquid
- unknown

- *II. Results (CCCFarming 2020-2023)*

EXAMPLE  
« GOOD PRACTICES »

*High Scraping frequency decrease the risk of having high NH<sub>3</sub> emissions*

• *II. Results (CCCFarming 2020-2023)*

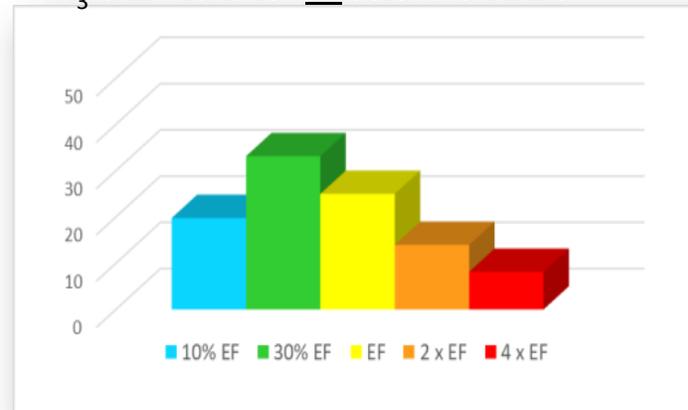

EXAMPLE  
« GOOD PRACTICES »

**Presence of Mattress**

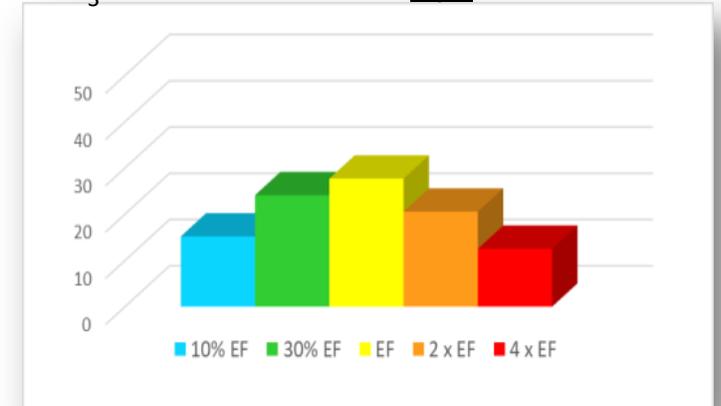

*All buildings with mattress showed low NH<sub>3</sub> emissions*

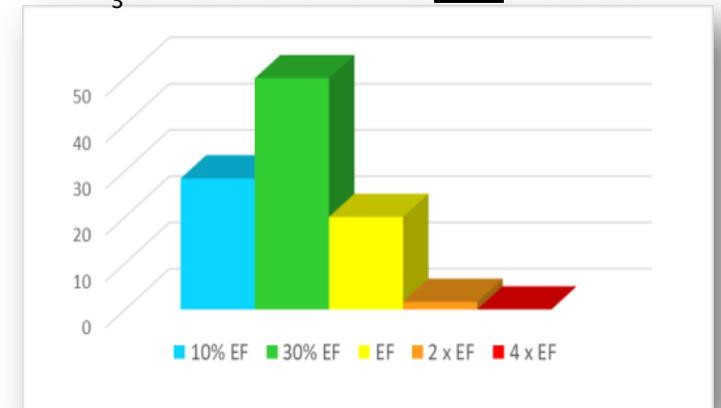

NH<sub>3</sub> emissions for **all** selected farms

NH<sub>3</sub> emissions for farms **w/o** mattress

NH<sub>3</sub> emissions for farms **with** mattress

**Criteria for farm selection:**

**similar housing:**

- ratio resting /walking area: 0,5 - 3 m<sup>2</sup> resting / m<sup>2</sup> walking
- slatted floor : excluded (absent or unknown)
- bedding: 0 - 5 kg litter /cow /day
- permanent housing (no grazing)

**similar herd data:**

- cow population: 20 - 220 dairy cow / house
- milk production: 20 - 45 L milk/day
- feed: 12 - 22 kg DMI/day

# *Road map...*

- *I. Development of the “Simplified Method”*
- *II. Results based on an international study*
- *III. Interest and perspectives*

### • *III. Interest and perspectives*

1. The “Simplified Method” uses **Carbon budget** instead of **air flow rate**

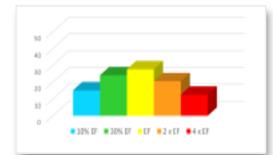

2. Designed to be used by **non-expert people** and for **acceptable costs**

3. **Robust method** applied to a **high number and diversity** of farming systems

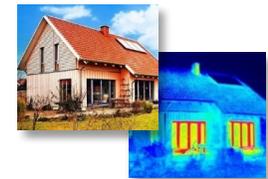

4. The “**farm signature**” is based on the **EF occurrence** within classes of values

5. Objectives are **to bring out** « hot spots » or better management practices, ie:

- decreasing the value and frequency of high emissions
- increasing frequency of low emissions and disseminating to other farms

- *III. Interest and perspectives*

There is a need to do as many on-farm measurements as possible to obtain a reliable “farm signature” and to evaluate as many farm as possible at the national level to set the most reliable “country signature” (which is used as reference).

Since it has been designed to be used by non-expert people and at low cost, it is achievable.

## *ANNEXES*

## Annexes – Method development

$$Emissions_{Gas} = (Q_{air} \times \rho_i) \times (C_{gas\ in} - C_{gas\ out})$$

- $Q_{air}$  : air flow rate
- $\rho_i$  : air density
- $C_{gas}$  : gas concentration

$$Emissions_{Gas} = A \times G_{gas}$$

$$A = \frac{E_{C-CH_4}}{G_{C-CH_4}} = \frac{E_{C-CO_2}}{G_{C-CO_2}} = \frac{E_{N-N_2O}}{G_{N-N_2O}} = \frac{E_{N-NH_3}}{G_{N-NH_3}}$$

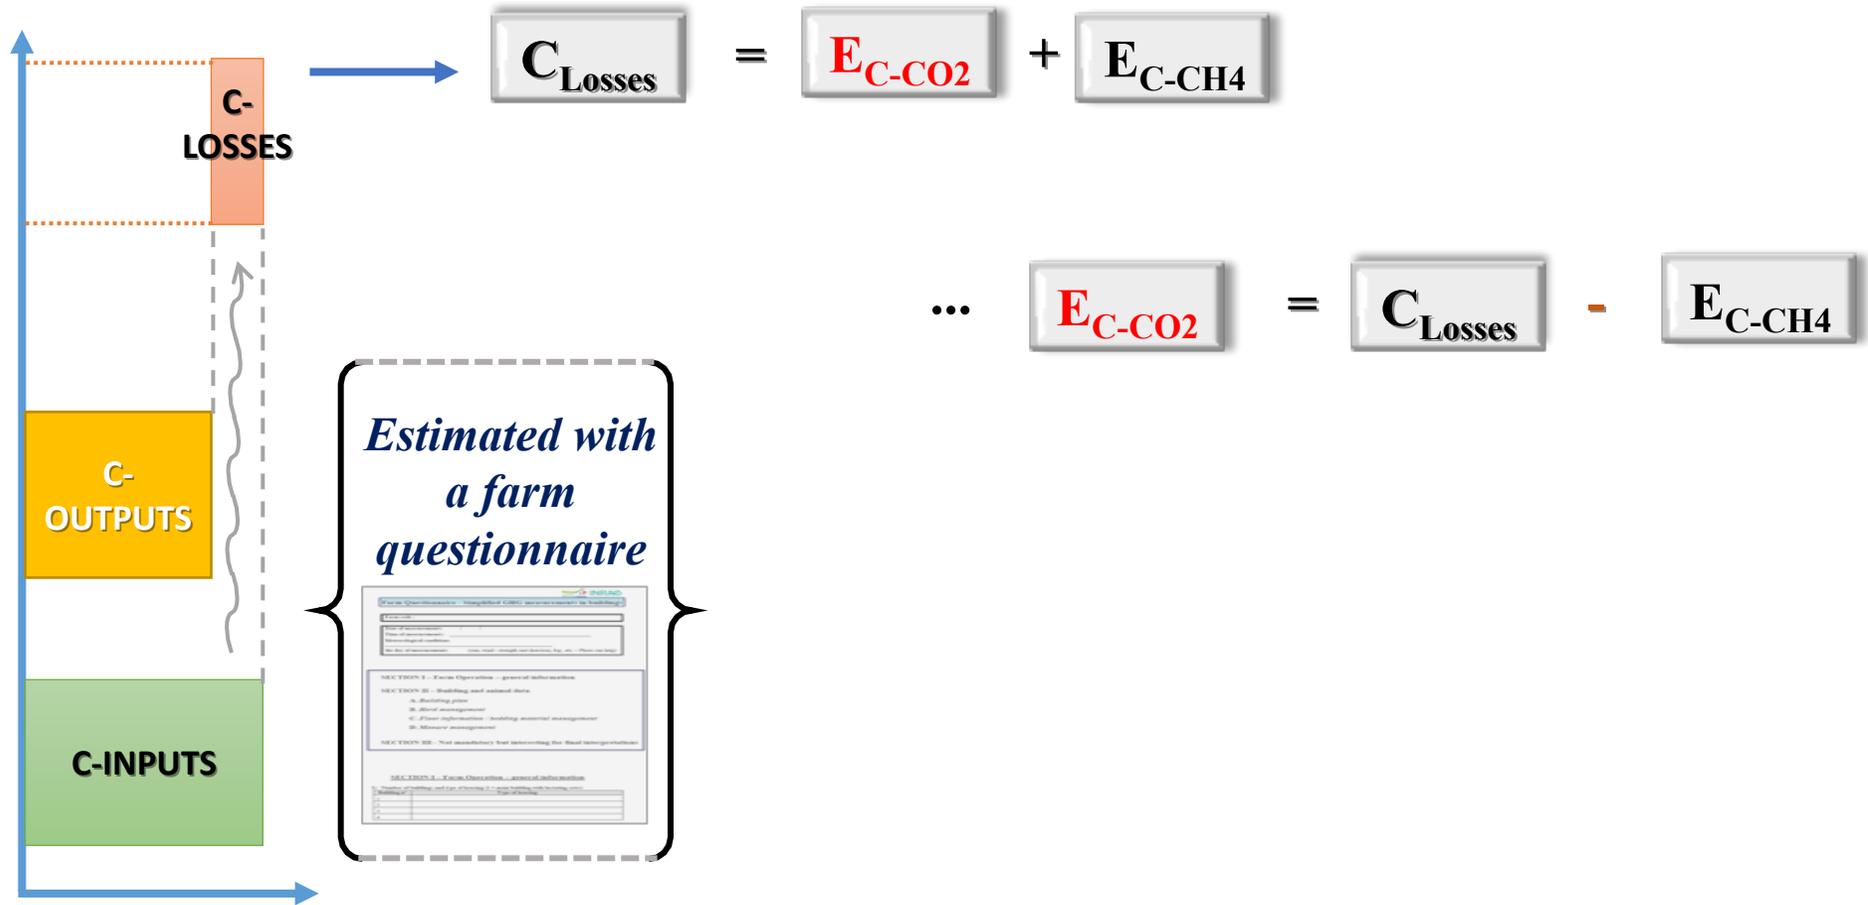

$$E_{C-CH_4} = E_{C-CO_2} \times \frac{G_{C-CH_4}}{G_{C-CO_2}}$$

$$E_{N-N_2O} = E_{C-CO_2} \times \frac{G_{N-N_2O}}{G_{C-CO_2}}$$

$$E_{N-NH_3} = E_{C-CO_2} \times \frac{G_{N-NH_3}}{G_{C-CO_2}}$$

Annexes – Method development

$$A = \frac{E_{C-CH4}}{G_{C-CH4}} = \frac{E_{C-CO2}}{G_{C-CO2}} = \dots \quad E_{C-CH4} = E_{C-CO2} \times \frac{G_{C-CH4}}{G_{C-CO2}}$$

*Annexes – Method development*

Since :

$$E_{C-CO_2} = C_{Losses} - E_{C-CH_4}$$

And :

$$E_{C-CH_4} = E_{C-CO_2} \times \frac{G_{C-CH_4}}{G_{C-CO_2}}$$

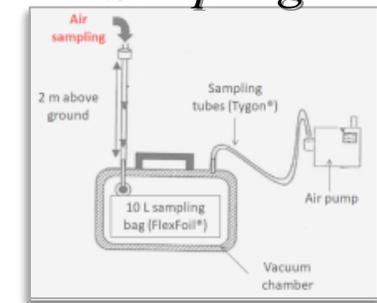

Then ...

$$E_{C-CO_2} = \frac{C_{Losses}}{\left(1 + \frac{G_{C-CH_4}}{G_{C-CO_2}}\right)}$$

*Questionnaire*

Form Screenshot: "Questionnaire" form with sections for farm information, management practices, and building details.

*Samplings*

## Annexes – Method development

$$Emissions_{Gas} = (Q_{air} \times \rho_i) \times (C_{gas_{in}} - C_{gas_{out}})$$

$$Emissions_{Gas} = A \times G_{gas}$$

$$A = \frac{E_{C-CH_4}}{G_{C-CH_4}} = \frac{E_{C-CO_2}}{G_{C-CO_2}} = \frac{E_{N-N_2O}}{G_{N-N_2O}} = \frac{E_{N-NH_3}}{G_{N-NH_3}}$$

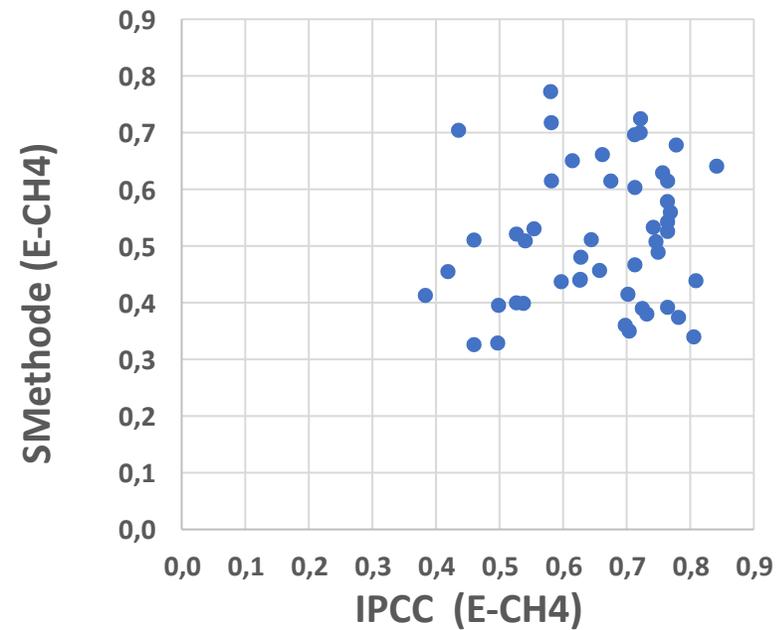

$$E_{C-CH_4} = E_{C-CO_2} \times \frac{G_{C-CH_4}}{G_{C-CO_2}}$$

$$E_{N-N_2O} = E_{C-CO_2} \times \frac{G_{N-N_2O}}{G_{C-CO_2}}$$

$$E_{N-NH_3} = E_{C-CO_2} \times \frac{G_{N-NH_3}}{G_{C-CO_2}}$$
