Introduction

02

- Lacaune sheep : 1st month = **Suckling milking** system
- **Energy deficiency** during this period → decrease in **milk production**
- Role of **microbiota** in ewes response

Is the ruminal microbiota of post-partum ewes linked to this energy deficit, and therefore to lower production?

Materials & methods

Animals

- 65 Lacaune dairy ewes
- Multiparous

Diet:

- 2/3 forages:
 - Alfalfa & cocksfoot hay
 - Grass silage
- 1/3 concentrates

Materials & methods

04

Sampling and follow-up

Materials & methods

Microbiota analysis

Sequencing:

- V3-V4 regions of 16S rRNA

Bioinformatics:

- Galaxy platform, FROGS
- SILVA base

- 258 samples (ie 4*65)
(2 ech removed - low number of sequences <6000)
- 21600 seq/sample
- 1932 ASVs / sample
- 104 genera

To reduce information

Unsupervised clustering:

- On total genera table with all samples from all dates
- Distance matrix based on Jensen-Shannon divergence
- Partition around medoids clustering
- Validation: silhouette coefficient

Mean Betahydroxybutyrate (BHB)

Mean Non esterified fatty acids (NEFA)

Conclusion

	RuM	RuP
	Mogibacterium Lachnospiraceae NK3A20 group	Prevotella Lachnospiraceae NK4A136 group
	BHB NEFA Milk production	VFA Milk fat Milk proteins 

- Microbiota → Link with lipomobilization
- High lipomobilization → higher milk production?

BHB: Betahydroxybutyrate
NEFA: Non esterified fatty acids
VFA: Volatile fatty acids
