A sector under pressure due to globalization

Map of the world production of wool (tons).

*Production saisonnière. Source : IWTO Wool Statistics 2015

China

- Leading importer of French wool
- Covid closes borders

Australia and New-Zealand

- 33% of world wool production
- Main wool breeds: Merino

Merinos

A crisis situation: price of sheep's wool falling around 0,10€/kg. Closure historic markets (China, North Africa...). Shearing cost are not covered. Wool not even collected in some farms...

An action plan: identify the factors that influence wool production (volume and quality) in order to improve its market value and guarantee better remuneration for breeders?

Study governance and working hypotheses

1 technical committee (23 members)

3 working hypothesis

1 **Pyrenean wool has a wide range of characteristics and qualities**, reflecting the diversity of Pyrenean territories and farming systems.

2 - **Strategies for adding value to wool vary**; breeders suffer from a lack of visibility in the short, medium and long term, and sometimes even from a lack of outlets.

3 - Farmers are keen **to find outlets for this product**, and are willing to commit to quality improvement initiatives **if remuneration is forthcoming**.

Dairy areas

Suckling areas

Schematic location of the basins of the various breeds present in the Pyrenees in 2021.

Personal figure, not exhaustive.

Fleeces with a wide range of characteristics

Overview of Pyrenean breeds (16)

Fleece color:

White, Saffron, brown,
beige, russet

**Fiber length:**

4,5cm to 30 cm

Fiber diameter:

23 μ m to 40 μ m

Fleece weight:

750g to 3,5 kg

Example of Manech tête noire

Fleece color:

Saffron

Fiber length:

22 cm to 30 cm

Fiber diameter:

38 μ m

Fleece weight:

1,7 kg

Varied practices

Ewe marking (n=175)

150 breeders (86%)

Pencil (38%)

Paint (32%)

spray can (30%)

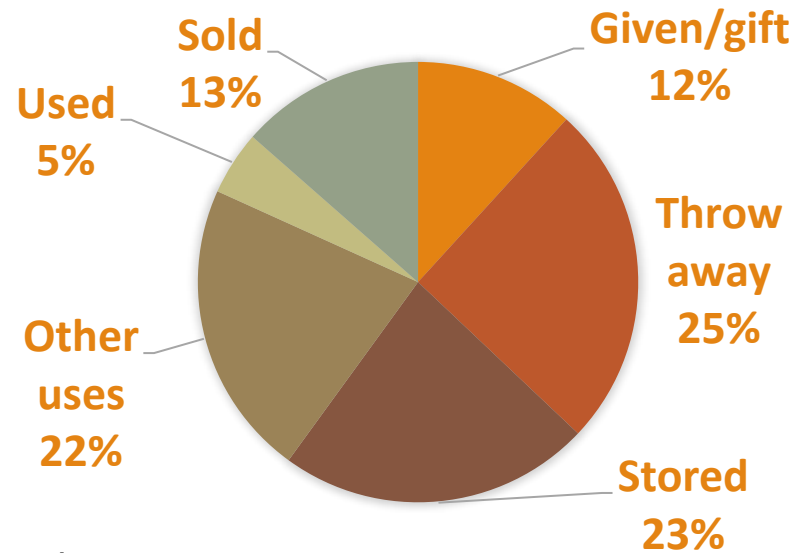

Grazing areas used by farmers (n=175)

Number of farms by type of grazing area

- farms with various types of grazing area
- farms with only one type of grazing area

Varied practices - but common expectations

What happens to wool on the farm? Source : surveys

Actual and target prices for wool

Source : surveys

	Nb answers	Av.	Méd.	Min	Max
Current selling price for breeders who have sold their wool (€/kg)	36	0,63	0,4	0,05	2,6
Asking price for clean wool	104	2,23	1,75	0,4	20
Minimum price for wool harvested without constraints	105	1,32	1	0	10
Current shearing costs	172	1,8	1,8	0	6

About a payment grid

Payment grid – 6 principles :

1. Progressive price
2. A price range
3. 2 types of grid
4. Detailed feedback to the breeder
5. Malus
6. Integration of thoroughly washed wool yield

Varied practices and situations: Introducing the 3 clusters

Used variables (9)

- Number of mowers
- Mowing deck
- Mower deck cleaning
- Sorting
- Selling price per kilo
- Interest-investment
- Minimum price for clean wool
- Evaluation of cleanliness level
- Evaluation of effort level

Illustrative variables

- Breed
- Shearing period
- Wool fate
- Transport
- Training
- Level of satisfaction
- Importance given
- Postal code
- Workshop location

Factor map

Distribution of breeders within the 3 typological groups

Disenchanted breeders: (58 farmers)

- No wool training
- Little attention paid to wool cleanliness
- Assessing their wool as currently dirty, with a high level of effort required to improve it

Breeders mobilized but disappointed: (78 farmers)

- Good estimate of wool cleanliness, so little effort required
- No sorting
- No outlets, store wool
- Generally dissatisfied with their situation

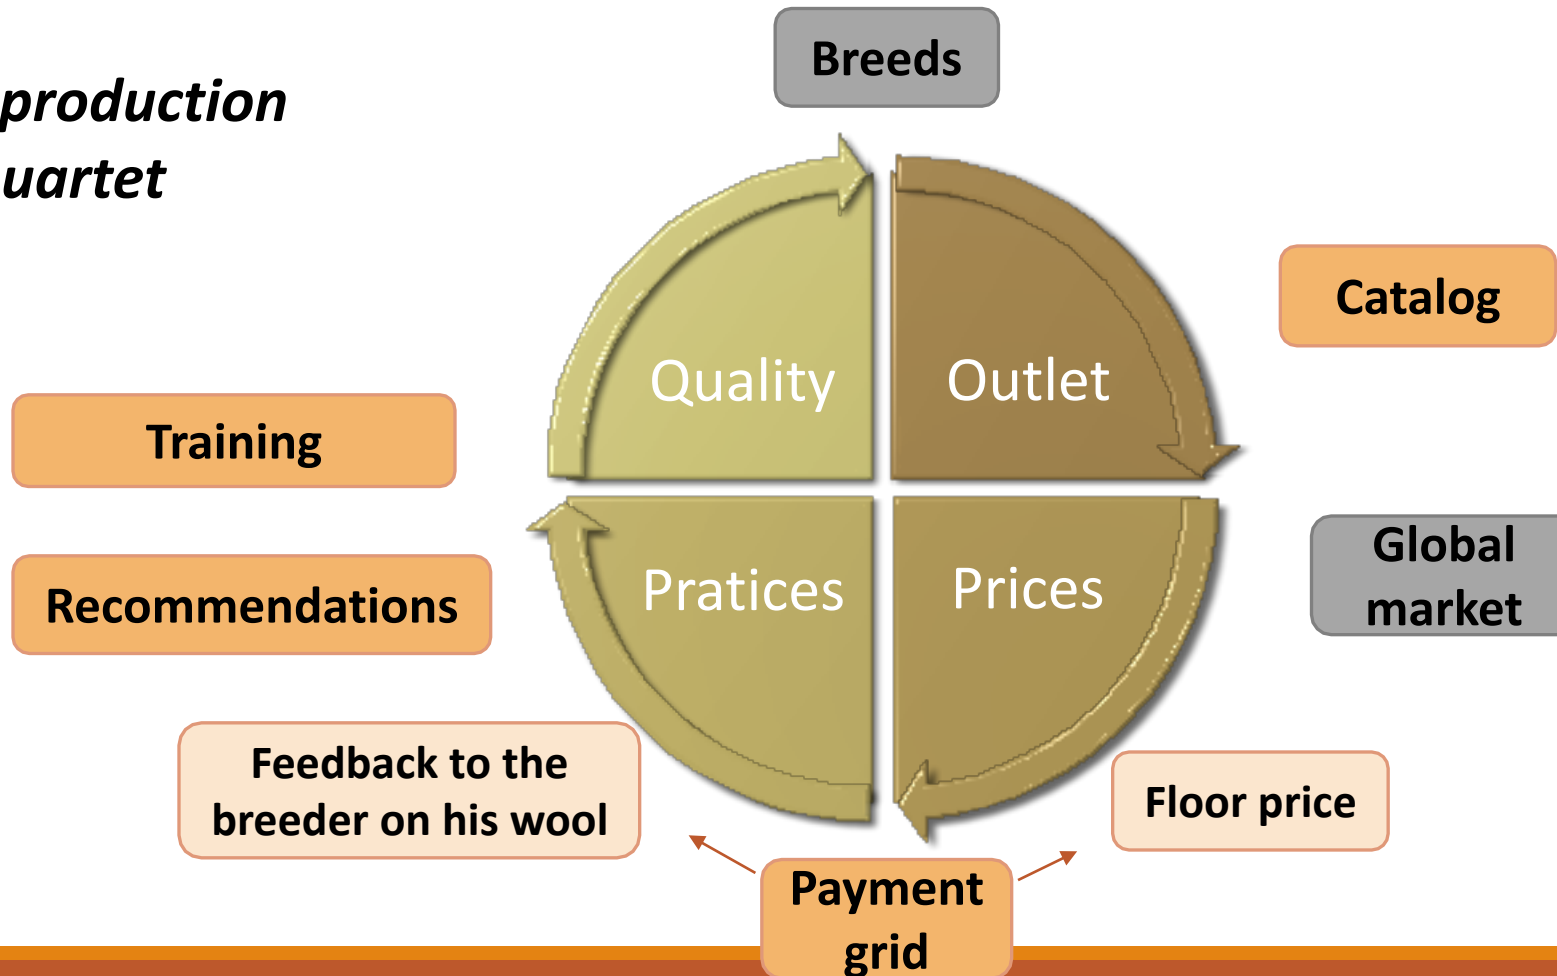

Committed and paid breeders: (39 farmers)

- Good mowing and sorting practices
- Give importance to cleanliness and take action
- Better value wool
- Are more satisfied

Conclusion

Ways to act on the factors that influence wool production (in terms of volume and quality) to enhance its value on the market and guarantee better remuneration for breeders

Wool production quartet

What role for wool in the future ?
